Customer Support

Technical Assistance

To search our knowledge base for a solution or to log in to the Technical Support portal and report a problem, go to honeywell.com/PSStechnicalsupport.

For our latest contact information, see honeywell.com/PSSlocations.

Product Service and Repair

Honeywell International Inc. provides service for all of its products through service centers throughout the world. Go to sps.honeywell.com and select **Support** > **Productivity** to find a service center near you or to get a Return Material Authorization number (RMA #) before returning a product.

Limited Warranty

For warranty information, go to sps.honeywell.com and select **Support** > **Productivity** > **Warranties**.

1 GETTING STARTED

About This Manual

This User's Guide provides installation and programming instructions for the Vuquest™ 3320 area-imaging scanner. Product specifications, dimensions, warranty, and customer support information are also included.

Honeywell barcode scanners are factory programmed for the most common terminal and communications settings. If you need to change these settings, programming is accomplished by scanning the barcodes in this guide.

An asterisk (*) next to an option indicates the default setting.

Note: *This User Guide includes commands and defaults that are affected by the software revision on your scanner. For more information about determining the software revision on your scanner, see About Software Revisions on page 6.*

Unpacking Your Device

After you open the shipping carton containing the product, take the following steps:

• Check for damage during shipment. Report damage immediately to the carrier who delivered the carton.

• Make sure the items in the carton match your order.

• Save the shipping container for later storage or shipping.

Connecting the Device

Connecting with USB

A scanner can be connected to the USB port of a computer.

1. Connect the appropriate interface cable to the device first, then to the computer.

Scanner USB Connection:
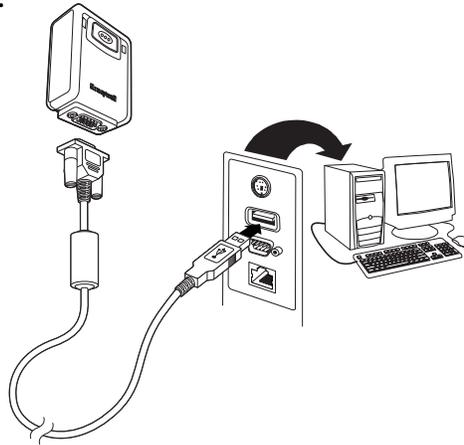

2. The scanner beeps.

3. Verify the scanner operation by scanning a barcode from the Sample Symbols, beginning on page 220.

The unit defaults to a USB PC Keyboard. Refer to page 9 for other USB terminal settings.

For additional USB programming and technical information, refer to "USB Application Note," available at sps.honeywell.com.

Connecting with Keyboard Wedge

A scanner can be connected between the keyboard and PC as a "keyboard wedge," where the scanner provides data output that is similar to keyboard entries. The following is an example of a keyboard wedge connection:

1. Turn Off power and disconnect the keyboard cable from the back of the terminal/computer.

2. Connect the appropriate interface cable to the device and to the terminal/computer.

Scanner Keyboard Wedge Connection:
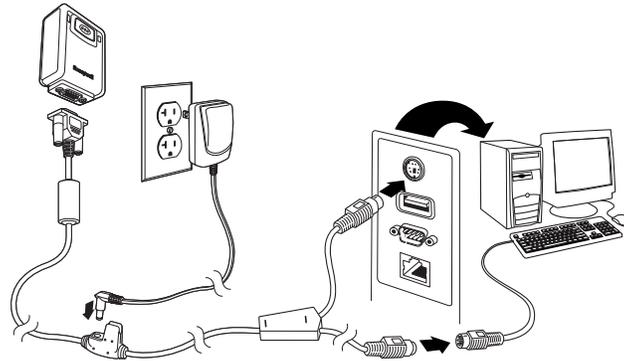

3. Turn the terminal/computer power back On. The scanner beeps.

4. Verify the scanner operation by scanning a barcode from the Sample Symbols, beginning on page 220. The scanner beeps once.

The unit defaults to an IBM PC AT and compatibles keyboard wedge interface with a USA keyboard. A carriage return (CR) suffix is added to barcode data.

Connecting with RS232 Serial Port

1. Turn Off power to the terminal/computer.

2. Connect the appropriate interface cable to the scanner.

Note: *For the scanner to work properly, you must have the correct cable for your type of terminal/computer.*

Scanner RS232 Serial Port Connection:
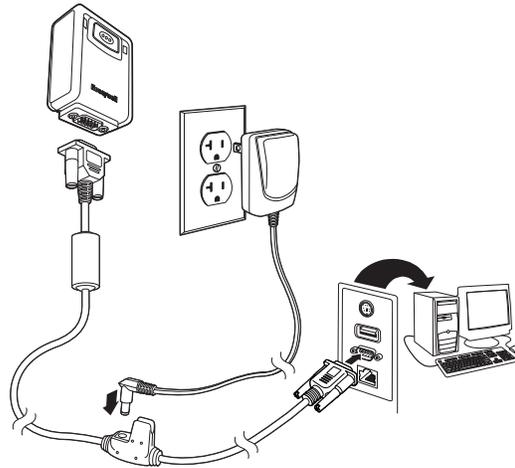

3. Plug the serial connector into the serial port on your computer. Tighten the two screws to secure the connector to the port.

4. Once the scanner has been fully connected, power up the computer.

This interface programs 115,200 baud, 8 data bits, no parity, and 1 stop bit.

Note: *Please note, the end of the cable with the ferrite plugs into the scanner. The end of the cable with the label "DO NOT connect this end to the barcode scanner" plugs into the computer.*

Reading Techniques

The scanner has a view finder that projects a bright green aiming beam that corresponds to the scanner's horizontal field of view. The aiming beam should be centered over the barcode, but it can be positioned in any direction for a good read.

Linear barcode   **2D Matrix symbol**
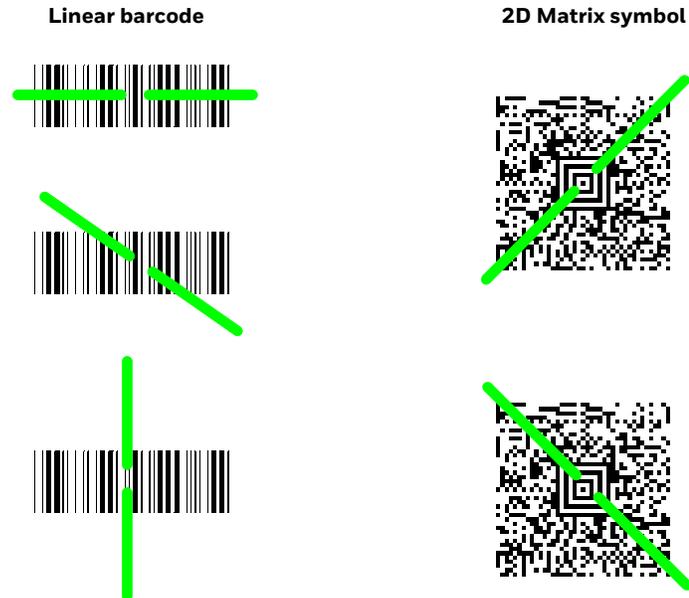

The aiming beam is smaller when the scanner is closer to the code and larger when it is farther from the code. Symbologies with smaller bars or elements (mil size) should be read closer to the unit. Symbologies with larger bars or elements (mil size) should be read farther from the unit. To read single or multiple symbols (on a page or on an object), hold the scanner at an appropriate distance from the target, push the button, and center the aiming beam on the symbol. If the code being scanned is highly reflective (e.g., laminated), it may be necessary to tilt the code up 15° to 18° to prevent unwanted reflection.

Menu Barcode Security Settings

Honeywell scanners are programmed by scanning menu barcodes or by sending serial commands to the scanner. If you want to restrict the ability to scan menu codes, you can use the Menu Barcode Security settings. Please contact the nearest technical support office (see Technical Assistance on page xiii) for further information.

Setting Custom Defaults

You have the ability to create a set of menu commands as your own, custom defaults. To do so, scan the Set Custom Defaults barcode below before scanning the menu commands for your custom defaults. If a menu command requires

scanning numeric codes from the Programming Chart, beginning on page 222, and then a Save code, that entire sequence will be saved to your custom defaults. When you have entered all the commands you want to save for your custom defaults, scan the Set Custom Defaults barcode.

MNUCDF.

Set Custom Defaults

MNUCDS.

Save Custom Defaults

You may have a series of custom settings and want to correct a single setting. To do so, just scan the new setting to overwrite the old one. For example, if you had previously saved the setting for Beeper Volume at Low to your custom defaults, and decide you want the beeper volume set to High, just scan the Set Custom Defaults barcode, then scan the Beeper Volume High menu code, and then scan Save Custom Defaults. The rest of the custom defaults will remain, but the beeper volume setting will be updated.

Resetting the Custom Defaults

If you want the custom default settings restored to your scanner, scan the Activate Custom Defaults barcode below. This is the recommended default barcode for most users. It resets the scanner to the custom default settings. If there are no custom defaults, it will reset the scanner to the factory default settings. Any settings that have not been specified through the custom defaults will be defaulted to the factory default settings.

DEFALT.

Activate Custom Defaults

About Software Revisions

This User Guide includes commands and defaults that are affected by the software revision on your scanner. The revisions are referred to as Gen 6 and Gen 7.

To determine the software revision on your scanner, use the Show Software Revision barcode (REVINF command) on page 170.

The response for this command includes a Software Part Number field that displays the software revision in the following formats:

- Gen 6 uses the format BYxxxxxxBAA
- Gen 7 uses the format GNxxxxxxBAA

PROGRAMMING THE INTERFACE

Introduction

This chapter describes how to program your system for the desired interface.

Programming the Interface – Plug and Play

Plug and Play barcodes provide instant scanner set up for commonly used interfaces.

Note: *After you scan one of the codes, power cycle the host terminal to have the interface in effect.*

Keyboard Wedge

If you want your system programmed for an IBM PC AT and compatibles keyboard wedge interface with a USA keyboard, scan the barcode below. Keyboard wedge is the default interface.

Note: *The following barcode also programs a carriage return (CR) suffix.*

PAP_AT.

IBM PC AT and Compatibles with CR suffix

Laptop Direct Connect

For most laptops, scanning the Laptop Direct Connect barcode allows operation of the scanner in parallel with the integral keyboard. The following Laptop Direct Connect barcode also programs a carriage return (CR) suffix and turns on Emulate External Keyboard (see).

PAPLTD.

Laptop Direct Connect
with CR suffix

RS232 Serial Port

The RS232 Interface barcode is used when connecting to the serial port of a PC or terminal. The following RS232 Interface barcode also programs a carriage return (CR) and a line feed (LF) suffix, baud rate, and data format as indicated below. It also changes the trigger mode to manual.

Option	Setting
Baud Rate	115,200 bps
Data Format	8 data bits, no parity bit, 1 stop bit

PAP232.

RS232 Interface

USB IBM SurePos

Scan one of the following "Plug and Play" codes to program the scanner for an IBM SurePos (USB handheld scanner) or IBM SurePos (USB tabletop scanner) interface.

Note: *After scanning one of these codes, you must power cycle the cash register.*

PAPSPH.

USB IBM SurePos
(USB Handheld Scanner)
Interface

PAPSPT.

USB IBM SurePos
(USB Tabletop Scanner)
Interface

Each barcode above also programs the following suffixes for each symbology:

Symbology	Suffix	Symbology	Suffix
EAN 8	0C	Code 39	00 0A 0B
EAN 13	16	Interleaved 2 of 5	00 0D 0B
UPC A	0D	Code 128	00 18 0B
UPC E	0A	Code 39	00 0A 0B

USB PC or Macintosh Keyboard

Scan one of the following codes to program the scanner for USB PC Keyboard or USB Macintosh Keyboard. Scanning these codes also adds a CR and LF.

PAP124.
USB Keyboard (PC)

PAP125.
USB Keyboard (Mac)

TRMUSB134.
USB Japanese Keyboard (PC)

USB HID

Scan the following code to program the scanner for USB HID barcode scanners.

PAP131.
USB HID Barcode Scanner

USB Serial

Scan the following code to program the scanner to emulate a regular RS232-based COM Port. If you are using a Microsoft® Windows® PC, you will need to download a driver from the Honeywell website (sps.honeywell.com). The driver will use the next available COM Port number. Apple® Macintosh computers recognize the scanner as a USB CDC class device and automatically use a class driver.

TRMUSB130.
USB Serial

Note: *No extra configuration (e.g., baud rate) is necessary.*

CTS/RTS Emulation

USBCTS1.
CTS/RTS Emulation On

USBCTS0.
* CTS/RTS Emulation Off

ACK/NAK Mode

USBACK1.
ACK/NAK Mode On

USBACK0.
* ACK/NAK Mode Off

Remote MasterMind™ for USB

When using a USB interface, you may wish to configure your scanner to communicate with Remote MasterMind Scanner Management Software (ReM). Scan the ReM On barcode to communicate with ReM. To disable this capability, scan ReM Off. *Default = ReM On.*

REMIFC0.
ReM Off

Verifone® Ruby Terminal Default Settings

Scan the following Plug and Play code to program the scanner for a Verifone Ruby terminal. This barcode sets the baud rate to 1200 bps and the data format to 8 data bits, Mark parity bit, 1 stop bit. It also adds a line feed (LF) suffix an programs the following prefixes for each symbology:

Symbology	Prefix
UPC-A	A
UPC-E	A
EAN-8	FF
EAN-13	F

```
PAPRBY.
```
Verifone Ruby Settings

Note: *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Gilbarco® Terminal Default Settings

Scan the following Plug and Play code to program the scanner for a Gilbarco terminal. This barcode sets the baud rate to 2400 bps and the data format to 7 data bits, even parity, 2 stop bits. It also adds a carriage return (CR) suffix and programs the following prefixes for each symbology:

Symbology	Prefix
UPC-A	A
UPC-E	E0
EAN-8	FF
EAN-13	F

```
PAPGLB.
```
Gilbarco Settings

Note: *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Honeywell Bioptic Aux Port Configuration

Scan the following Plug and Play code to program the scanner for a Honeywell bioptic scanner auxiliary port configuration. This barcode sets the baud rate to 38400 bps and the data format to 8 data bits, no parity, 1 stop bit.

PAPBIO.

Honeywell Bioptic Settings

Note: *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Datalogic™ Magellan© Aux Port Configuration

Scan the following Plug and Play code to program the scanner for a Datalogic Magellan auxiliary port configuration. This barcode sets the baud rate to 9600 bps and the data format to 8 data bits, no parity, 1 stop bit.

PAPMAG.

Datalogic Magellan Bioptic Settings

Note: *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

NCR Bioptic Aux Port Configuration

Scan the following Plug and Play code to program the scanner for an NCR bioptic scanner auxiliary port configuration. The communication should be set at 9600bps baud rate, 7 data bit data format, even parity, and 1 stop bit. The following prefixes are programmed for each symbology:

Symbology	Prefix	Symbology	Prefix
UPC-A	A	Interleaved 2 of 5	b
UPC-E	E0	Code 128	f
		GS1 DataBar Omnidirectional	r
EAN-8	FF	GS1 DataBar Expanded	r
EAN-13	F	Codabar	N
Code 39	a	Code 32 Pharmaceutical (PARAF)	a

NCR Bioptic Settings

> *Note:* *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Wincor Nixdorf Terminal Default Settings

Scan the following Plug and Play code to program the scanner for a Wincor Nixdorf terminal. This barcode sets the baud rate to 9600 bps and the data format to 8 data bits, no parity, 1 stop bit.

Wincor Nixdorf Terminal Settings

> *Note:* *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Wincor Nixdorf Beetle™ Terminal Default Settings

Scan the following Plug and Play code to program the scanner for a Wincor Nixdorf Beetle terminal. The following prefixes are programmed for each symbology:

Symbology	Prefix	Symbology	Prefix
Aztec Code	V	Interleaved 2 of 5	I
Codabar	N	MaxiCode	T
Code 93	L	MicroPDF417	S
Code 128	K	PDF417	Q
Data Matrix	R	QR Code	U
EAN-8	B	Straight 2 of 5 IATA	H
EAN-13	A	UPC-A	A0
GS1 DataBar	E	UPC-E	C
GS1-128	P	All other barcodes	M

Wincor Nixdorf Beetle Settings

> *Note:* *If you are having unexpected results with this programming code, scan the Activate Defaults barcode on* page 6 *first, then scan the programming code above.*

Keyboard Country Layout

If your interface is USB Keyboard or Keyboard Wedge, your keyboard layout default is a US keyboard. To change this layout, refer to the chart below for your keyboard country. Scan the appropriate barcode below to change the layout.

By default, national character replacements are used for the following characters: #$@[\]^'{|}~ See the Symbology Charts, beginning on page 211, to view the character replacements for each country. ,

Keyboard Style

This programs keyboard styles, such as Caps Lock and Shift Lock. If you have used Keyboard Conversion settings, they will override any of the following Keyboard Style settings. *Default = Regular.*

Regular is used when you normally have the Caps Lock key Off.

KBDSTY0.
* Regular

Caps Lock is used when you normally have the Caps Lock key On.

KBDSTY1.
Caps Lock

Shift Lock is used when you normally have the Shift Lock key On (not common to U.S. keyboards).

KBDSTY2.
Shift Lock

Automatic Caps Lock is used if you change the Caps Lock key On and Off. The software tracks and reflects if you have Caps Lock On or Off. This selection can only be used with systems that have an LED that notes the Caps Lock status (AT keyboards).

KBDSTY6.
Automatic Caps Lock

Autocaps via NumLock barcode should be scanned in countries (e.g., Germany, France) where the Caps Lock key cannot be used to toggle Caps Lock. The NumLock option works similarly to the regular Autocaps, but uses the NumLock key to retrieve the current state of the Caps Lock.

KBDSTY7.

Autocaps via NumLock

Emulate External Keyboard should be scanned if you do not have an external keyboard (IBM AT or equivalent).

KBDSTY5.

Emulate External Keyboard

Note: *After scanning the Emulate External Keyboard barcode, you must power cycle your computer.*

Keyboard Conversion

Alphabetic keyboard characters can be forced to be all upper case or all lower case. So if you have the following barcode: "abc569GK," you can make the output "ABC569GK" by scanning Convert All Characters to Upper Case, or to "abc569gk" by scanning Convert All Characters to Lower Case.

These settings override Keyboard Style selections.

Note: *If your interface is a keyboard wedge, first scan the menu code for Automatic Caps Lock on page 21. Otherwise, your output may not be as expected.*

Default = Keyboard Conversion Off.

KBDCNV0.

* Keyboard Conversion Off

KBDCNV1.

**Convert All Characters
to Upper Case**

KBDCNV2.

**Convert All Characters
to Lower Case**

Control Character Output

This selection sends a text string instead of a control character. For example, when the control character for a carriage return is expected, the output would display [CR] instead of the ASCII code of 0D. Refer to ASCII Conversion Chart (Code Page 1252) on page 214. Only codes 00 through 1F are converted (the first column of the chart).

Note: *Control + X (Control + ASCII) Mode overrides this mode.*

Default = Off.

KBDNPE1.

Control Character Output On

KBDNPE0.

* Control Character Output Off

Keyboard Modifiers

This modifies special keyboard features, such as CTRL+ ASCII codes and Turbo Mode.

Control + X (Control + ASCII) Mode On

The scanner sends key combinations for ASCII control characters for values 00–1F. Windows is the preferred mode. All keyboard country codes are supported. DOS mode is a legacy mode, and it does not support all keyboard country codes. New users should use the Windows mode. Refer to ASCII Conversion Chart (Code Page 1252) on page 214 for CTRL+ X Values.

Windows Mode Prefix/Suffix Off: The scanner sends key combinations for ASCII control characters for values 00–1F, but it does not translate any prefix or suffix information.

Default = Control + X Mode Off.

KBDCAS2.

Windows Mode Control + X Mode On

KBDCAS0.

* Control + X Mode Off

KBDCAS1.

DOS Mode Control + X Mode On

KBDCAS3.

Windows Mode Prefix/Suffix

Turbo Mode: The scanner sends characters to a terminal faster. If the terminal drops characters, do not use Turbo Mode. *Default = Off.*

KBDTMD1.

Turbo Mode On

KBDTMD0.

* Turbo Mode Off

Numeric Keypad Mode: Sends numeric characters as if entered from a numeric keypad. *Default = Off.*

KBDNPS1.

Numeric Keypad Mode On

KBDNPS0.

* Numeric Keypad Mode Off

Automatic Direct Connect Mode: This selection can be used if you have an IBM AT style terminal and the system is dropping characters. *Default = Off.*

KBDADC1.

Automatic Direct Connect Mode On

KBDADC0.

* Automatic Direct Connect Mode Off

RS232 Modifiers

RS232 Baud Rate

Baud Rate sends the data from the scanner to the terminal at the specified rate. The host terminal must be set for the same baud rate as the scanner. *Default = 115,200.*

RS232 Word Length: Data Bits, Stop Bits, and Parity

Data Bits sets the word length at 7 or 8 bits of data per character. If an application requires only ASCII Hex characters 0 through 7F decimal (text, digits, and punctuation), select 7 data bits. For applications that require use of the full ASCII set, select 8 data bits per character. *Default = 8.*

Stop Bits sets the stop bits at 1 or 2. *Default = 1.*

Parity provides a means of checking character bit patterns for validity. *Default = None.*

232WRD3.
7 Data, 1 Stop, Parity Even

232WRD0.

232WRD8.
8 Data, 1 Stop, Parity Odd

```
||||||||||||||||||||||||||||||||
232WRD14.
```
8 Data, 1 Stop, Parity Mark

RS232 Receiver Time-Out

The unit stays awake to receive data until the RS232 Receiver Time-Out expires. A manual or serial trigger resets the time-out. When an RS232 receiver is sleeping, a character may be sent to wake up the receiver and reset the time-out. A transaction on the CTS line will also wake up the receiver. The receiver takes 300 milliseconds to completely come up. Change the RS232 receiver time-out by scanning the barcode below, then scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**. The range is 0 to 300 seconds. *Default = 0 seconds (no time-out - always on).*

```
||||||||||||||||||||||||||||||||
232LPT.
```
RS232 Receiver Time-Out

RS232 Handshaking

RS232 Handshaking allows control of data transmission from the scanner using software commands from the host device. When RTS/CTS is turned Off, no data flow control is used.

Flow Control, No Timeout: The scanner asserts RTS when it has data to send, and will wait indefinitely for CTS to be asserted by the host.

Two-Direction Flow Control: The scanner asserts RTS when it is OK for the host to transmit. The host asserts CTS when it is OK for the device to transmit.

Flow Control with Timeout: The scanner asserts RTS when it has data to send and waits for a delay (see RS232 Timeout on page 29) for CTS to be asserted by the host. If the delay time expires and CTS is not asserted, the device transmit buffer is cleared and scanning may resume.
Default = RTS/CTS Off.

```

         232CTS0.
```
* RTS/CTS Off

RS232 Timeout

When using Flow Control with Timeout, you must program the length of the delay you want to wait for CTS from the host. Set the length (in milliseconds) for a timeout by scanning the barcode below, then setting the timeout (from 1-5100 milliseconds) by scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**.

```
||| |||||||||| || |||||| |||
         232DEL.
```
RS232 Timeout

XON/XOFF

Standard ASCII control characters can be used to tell the scanner to start sending data (XON/XOFF On) or to stop sending data (XON/XOFF Off). When the host sends the XOFF character (DC3, hex 13) to the scanner, data transmission stops. To resume transmission, the host sends the XON character (DC1, hex 11). Data transmission continues where it left off when XOFF was sent. *Default = XON/XOFF Off*.

```
||| |||||||| || ||||||||| |||||
        232XON1.
```
XON/XOFF On

```
||| |||||||| ||| |||| |||||||
         232XON0.
```
* XON/XOFF Off

ACK/NAK

After transmitting data, the scanner waits for an ACK character (hex 06) or a NAK character (hex 15) response from the host. If ACK is received, the communications cycle is completed and the scanner looks for more barcodes. If NAK is received, the

last set of barcode data is retransmitted and the scanner waits for ACK/NAK again. Turn On the ACK/NAK protocol by scanning the ACK/NAK On barcode below. To turn Off the protocol, scan ACK/NAK Off. *Default = ACK/NAK Off*.

232ACK1.

ACK/NAK On

232ACK0.

* ACK/NAK Off

Scanner to Bioptic Communication

The following settings are used to set up communication between Honeywell scanners and bioptic scanners.

Note: *The scanner's baud rate must be set to 38400 and the RS232 timeout must be set to 3000 in order to communicate with a bioptic scanner. See RS232 Modifiers on page 25 and RS232 Timeout on page 29 for further information.*

Scanner-Bioptic Packet Mode

Packet Mode On must be scanned to set the scanner's format so it is compatible with a bioptic scanner. *Default = Packet Mode Off*.

232PKT0.

* Packet Mode Off

232PKT2.

Packet Mode On

Scanner-Bioptic ACK/NAK Mode

Bioptic ACK/NAK On must be scanned so the scanner will wait for an ACK or NAK from a bioptic scanner after each packet is sent. The Scanner-Bioptic ACK/NAK Timeout (below) controls how long the scanner will wait for a response. *Default = Bioptic ACK/NAK Off*.

232NAK0.

* Bioptic ACK/NAK Off

Scanner-Bioptic ACK/NAK Timeout

This allows you to set the length (in milliseconds) for a timeout for a bioptic scanner's ACK/NAK response. Scan the barcode below, then set the timeout (from 1-30,000 milliseconds) by scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**. *Default = 5100*.

```
232DLK.
```
ACK/NAK Timeout

INPUT/OUTPUT SETTINGS

Power Up Beeper

The scanner can be programmed to beep when it's powered up. Scan the Off barcode(s) if you don't want a power up beep. *Default = Power Up Beeper On – Scanner.*

```
DLYGRD.
```
User-Specified Good Read Delay

Manual Trigger Modes

When in manual trigger mode, the scanner scans until a barcode is read, or until the button is released. Two modes are available, Normal and Enhanced. Normal mode offers good scan speed and the longest working ranges (depth of field). Enhanced mode will give you the highest possible scan speed but slightly less

range than Normal mode. Enhanced mode is best used when you require a very fast scan speed and don't require a long working range. *Default = Manual Trigger– Normal.*

```
PAPHHF.
```
* Manual Trigger – Normal

```
PAPHHS.
```

EXPMOD0.

Set Exposure Mode – Manual Trigger Mode

LED Illumination Exposure Mode – Presentation Mode

For scanners with the Gen 7 software revision that are using Presentation Mode, you must first scan the Set Exposure Mode – Presentation Mode barcode before scanning one of the LED Illumination – Manual Trigger barcodes.
Default = Automatic Exposure – Presentation Mode.

Note: *For infomation about software revisions, see About Software Revisions on page 6.*

EXPMDL4.

* Automatic Exposure – Presentation Mode

EXPMDL0.

Set Exposure Mode – Presentation Mode

Serial Trigger Mode

You can activate the scanner either by pushing the button, or using a serial trigger command (see Trigger Commands on page 178). When in serial mode, the scanner scans until a barcode has been read or until the deactivate command is sent. The scanner can also be set to turn itself Off after a specified time has elapsed (see Read Time-Out, which follows).

Read Time-Out

Use this selection to set a time-out (in milliseconds) of the scanner's button when using serial commands to trigger the scanner. Once the scanner has timed out, you can activate the scanner either by pushing the button or using a serial trigger command. After scanning the Read Time-Out barcode, set the time-out duration (from 0-300,000 milliseconds) by scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**. *Default = 30,000 ms.*

TRGSTO.
Read Time-Out

Presentation Mode

Presentation Mode uses ambient light and scanner illumination to detect barcodes. When in Presentation Mode, the LEDs remain dim until a barcode is presented to the scanner, then the aimer turns On and the LEDs turn up to read the code. If the light level in the room is not high enough, Presentation Mode may not work properly.

Scan the following barcode to program your scanner for Presentation Mode.

PAPTPR.
Presentation Mode

LED Illumination – Presentation Mode

If you wish to set the LED illumination brightness, scan one of the barcodes below. This sets the LED illumination for the scanner when it is in Presentation Mode. If the scanner is triggered manually, the LED illumination will switch to the setting for a manual trigger. (See LED Illumination – Manual Trigger on page 38.) *Default = High.*

Note: *This command is not supported by the Gen 7 software revision. For scanners with the Gen 7 revision, use LED Illumination – Manual Trigger on page 38 for both Presentation Mode and Manual Mode. For infomation about software revisions, see About Software Revisions on page 6.*

Note: *The LEDs are like a flash on a camera. The lower the ambient light in the room, the brighter the LEDs need to be so the scanner can "see" the barcodes.*

Presentation LED Behavior after Decode

When a scanner is in presentation mode, the LEDs dim 30 seconds after a barcode is decoded. If you wish to dim the LEDs immediately after a barcode is decoded, scan the LEDs Off barcode, below. *Default = LEDs On.*

TRGPCK1.
* LEDs On

TRGPCK0.
LEDs Off

Presentation Sensitivity

Presentation Sensitivity is a numeric range that increases or decreases the scanner's reaction time to barcode presentation. To set the sensitivity, scan the Sensitivity barcode, then scan the degree of sensitivity (from 0–20) from the Programming Chart, beginning on page 222, and **Save**. 0 is the most sensitive setting, and 20 is the least sensitive. *Default = 1.*

Note: *This command is not supported with the Gen 7 software revision. For infomation about software revisions, see About Software Revisions on page 6.*

TRGPMS.
Sensitivity

Presentation Centering

Use Presentation Centering to narrow the scanner's field of view when it is in Presentation Mode to make sure the scanner reads only those barcodes intended by the user. For instance, if multiple codes are placed closely together, Presentation Centering will insure that only the desired codes are read.

Note: *To adjust centering when the scanner is hand-held, see Centering on page 51.*

If a barcode is not touched by a predefined window, it will not be decoded or output by the scanner. If Presentation Centering is turned On by scanning Presentation Centering On, the scanner only reads codes that pass through the centering window you specify using the Top of Presentation Centering Window, Bottom of Presentation Centering Window, Left, and Right of Presentation Centering Window barcodes.

In the example below, the white box is the centering window. The centering window has been set to 20% left, 30% right, 8% top, and 25% bottom. Since Barcode 1 passes through the centering window, it will be read. Barcode 2 does not pass through the centering window, so it will not be read.
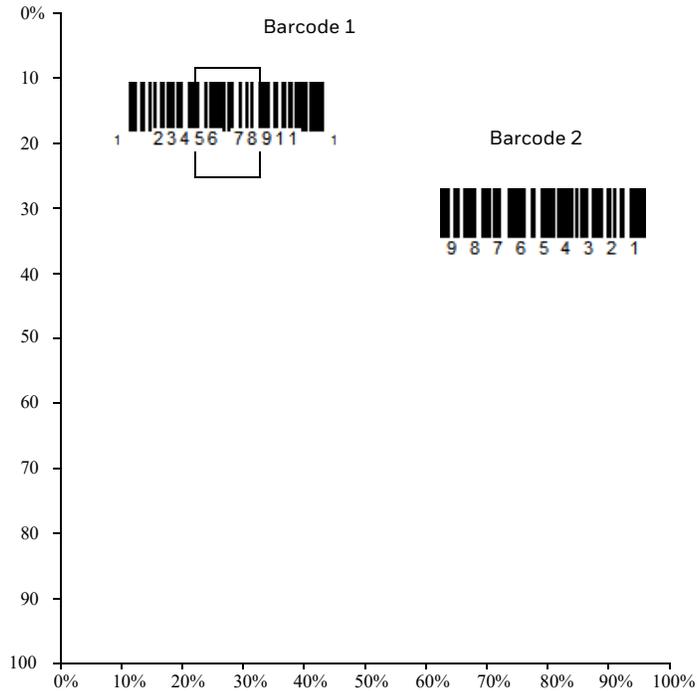

Note: *A barcode needs only to be touched by the centering window in order to be read. It does not need to pass completely through the centering window.*

Scan Presentation Centering On, then scan one of the following barcodes to change the top, bottom, left, or right of the centering window. Then scan the percent you want to shift the centering window using digits from the Programming Chart, beginning on page 222, and then scan **Save**. *Default Presentation Centering = 40% for Top and Left, 60% for Bottom and Right.*

```
||||| ||| |||| || ||| ||||| |||
AOSCGD1.
```
**CodeGate On
Out–of–Stand**

Streaming Presentation™ Mode

When in Streaming Presentation mode, the scanner's aimer goes out after a short time, but the scan illumination remains On all the time to continuously search for barcodes. Two modes are available, Normal and Enhanced. Normal mode offers good scan speed and the longest working ranges (depth of field). Enhanced mode will give you the highest possible scan speed but slightly less range than Normal mode. Enhanced mode is best used when you require a very fast scan speed and don't require a long working range.

```
||||| ||| |||| || ||| ||||| |||
PAPSPN.
```
**Streaming Presentation
Mode – Normal**

**Streaming Presentation
Mode – Enhanced**

When using Preferred Symbology on page 52, a lower priority symbol must be centered on the aiming pattern to be read in Streaming Presentation Mode.

Mobile Phone Read Mode

When this mode is selected, your scanner is optimized to read barcodes from mobile phone or other LED displays. However, the speed of scanning printed barcodes may be slightly lower when this mode is enabled. You can enable Mobile Phone Reading for either a hand held device, or for a hands-free (presentation) application.

**Hand Held Scanning – Mobile
Phone**

**Streaming Presentation –
Mobile Phone**

> **Note:** To turn Off Mobile Phone Read Mode, scan a Manual or Serial Trigger Mode barcode (see page *37*).

Hands-Free Time-Out

The Presentation Mode is referred to as "hands-free" mode. If the scanner's button is pushed when using a hands-free mode, the scanner changes to manual trigger mode. You can set the time the scanner should remain in manual trigger mode by setting the Hands-Free Time-Out. Once the time-out value is reached, (if there have been no further button pushes) the scanner reverts to the original hands-free mode.

Scan the Hands-Free Time-Out barcode, then scan the time-out duration (from 0– 300,000 milliseconds) from the Programming Chart, beginning on page 222, and then scan **Save**. *Default = 5,000 ms.*

Hands-Free Time-Out

Character Activation Mode

You may use a character sent from the host to trigger the scanner to begin scanning. When the activation character is received, the scanner continues scanning until either the Character Activation Laser Timeout on page 46, the deactivation character is received (see Deactivation Character on page 48), or a barcode is transmitted. Scan the following On barcode to use character activation, then use Activation Character (following) to select the character you will send from the host to start scanning. *Default = Off.*

* Off

On

Activation Character

This sets the character used to trigger scanning when using Character Activation Mode. On the ASCII Conversion Chart (Code Page 1252) on page 214, find the hex value that represents the character you want to use to trigger scanning. Scan the following barcode, then use the Programming Chart, beginning on page 222, to read the alphanumeric combination that represents that ASCII character. Scan **Save** to finish.

Activation Character

Character Activation Laser Timeout

You can set a timeout for the length of time the laser remains On and attempting to decode barcodes when using Character Activation Mode. Set the length (in milliseconds) for a timeout by scanning the following barcode, then setting the timeout (from 1–65535 milliseconds) by scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**. *Default = 5000 ms.*

Character Activation Laser Timeout

Character Deactivation Mode

If you have sent a character from the host to trigger the scanner to begin scanning, you can also send a deactivation character to stop scanning. Scan the following On barcode to use character deactivation, then use Deactivation Character (following) to select the character you will send from the host to terminate scanning. *Default = Off.*

HSTDEN0.
* Off

HSTDEN1.
On

End Character Activation After Good Read

After a barcode is successfully detected and read from the scanner, the illumination can be programmed either to remain On and scanning, or to turn Off. When End Character Activation After Good Read is enabled, the illumination turns Off and stops scanning after a good read. If you scan Do Not End Character Activation After Good Read, the illumination remains On after a good read. *Default = End Character Activation After Good Read.*

HSTCGD0.
**Do Not End Character
Activation After Good Read**

HSTCGD1.
*** End Character Activation
After Good Read**

Character Activation Timeout

You can set a timeout for the length of time the illumination remains On and attempting to decode barcodes when using Character Activation Mode. Set the length (in milliseconds) for a timeout by scanning the following barcode, then setting the timeout (from 1–300,000 milliseconds) by scanning digits ffrom the Programming Chart, beginning on page 222, then scanning **Save**. *Default = 30,000 ms.*

HSTCDT.
Character Activation Timeout

Deactivation Character

This sets the character used to terminate scanning when using Character Deactivation Mode. On the ASCII Conversion Chart (Code Page 1252) on page 214, find the hex value that represents the character you want to use to terminate scanning. Scan the following barcode, then use the Programming Chart, beginning on page 222, to read the alphanumeric combination that represents that ASCII character. Scan **Save** to finish.

HSTDCH.
Deactivation Character

Reread Delay

This sets the time period before the scanner can read the *same* barcode a second time. Setting a reread delay protects against accidental rereads of the same barcode. Longer delays are effective in minimizing accidental rereads. Use shorter delays in applications where repetitive barcode scanning is required. Reread Delay only works when in a Presentation Mode (see page 40). *Default = Medium.*

DLYRRD500.
Short (500 ms)

DLYRRD750.
* Medium (750 ms)

DLYRRD1000.

Illumination Lights

If you want the illumination lights On while reading a barcode, scan the Lights On barcode, below. However, if you want to turn just the lights Off, scan the Lights Off barcode. *Default = Lights On.*

Note: *This setting does not affect the aimer light. The aiming light can be set using Aimer Mode (see page 50).*

SCNLED1.

* Lights On

SCNLED0.

Lights Off

Aimer Delay

The aimer delay allows a delay time for the operator to aim the scanner before the picture is taken. Use these codes to set the time between when the button is pushed and when the picture is taken. During the delay time, the aiming light will appear, but the LEDs won't turn On until the delay time is over. *Default = Off.*

SCNDLY200.
200 milliseconds

SCNDLY400.
400 milliseconds

SCNDLY0.
* Off (no

User-Specified Aimer Delay

If you want to set your own length for the duration of the delay, scan the barcode below, then set the time-out by scanning digits (0 – 4,000 ms) from the Programming Chart, beginning on page 222, then scan **Save**.

SCNDLY.
Delay Duration

Aimer Mode

This feature allows you to turn the aimer On and Off. When the Interlaced barcode is scanned, the aimer is interlaced with the illumination LEDs. *Default = Interlaced.*

SCNAIM0.
Off

SCNAIM2.
* Interlaced

Centering

Use Centering to narrow the scanner's field of view to make sure that when the scanner is hand-held, it reads only those barcodes intended by the user. For instance, if multiple codes are placed closely together, centering will insure that only the desired codes are read. (Centering can be used in conjunction with Aimer Delay (see page 50), for the most error-free operation in applications where multiple codes are spaced closely together. Using the Aimer Delay and Centering features, the scanner can emulate the operation of older systems, such as linear laser barcode scanners.)

Note: *To adjust centering when the scanner is in Presentation Mode, see Presentation Centering on page 42.*

If a barcode is not touched by a predefined window, it will not be decoded or output by the scanner. If Centering On is checked, the scanner only reads codes that pass through the centering window you specify using the Top of Centering Window, Bottom of Centering Window, Left, and Right of Centering Window selections.

In the example below, the white box is the centering window. The centering window has been set to 20% left, 30% right, 8% top, and 25% bottom. Since Barcode 1 passes through the centering window, it will be read. Barcode 2 does not pass through the centering window, so it will not be read.
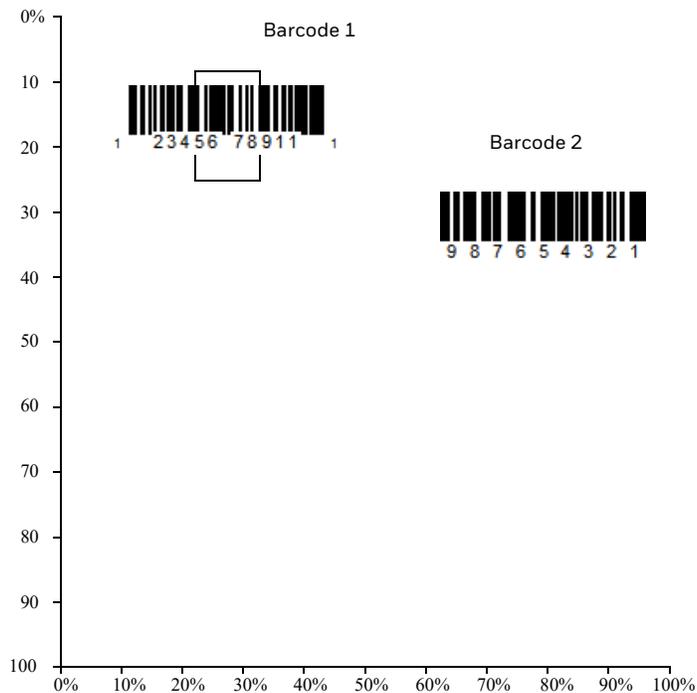

Note: *A barcode needs only to be touched by the centering window in order to be read. It does not need to pass completely through the centering window.*

Scan Centering On, then scan one of the following barcodes to change the top, bottom, left, or right of the centering window. Then scan the percent you want to shift the centering window using digits from the Programming Chart, beginning on page 222, and scan **Save**. *Default Centering = 40% for Top and Left, 60% for Bottom and Right.*

Preferred Symbology

The scanner can be programmed to specify one symbology as a higher priority over other symbologies in situations where both barcode symbologies appear on the same label, but the lower priority symbology cannot be disabled.

For example, you may be using the scanner in a retail setting to read U.P.C. symbols, but have occasional need to read a code on a drivers license. Since some licenses have a Code 39 symbol as well as the PDF417 symbol, you can use Preferred Symbology to specify that the PDF417 symbol be read instead of the Code 39.

Preferred Symbology classifies each symbology as high priority, low priority, or as an unspecified type. When a low priority symbology is presented, the scanner ignores it for a set period of time (see Preferred Symbology Time-out on page 54) while it searches for the high priority symbology. If a high priority symbology is located during this period, then that data is read immediately.

If the time-out period expires before a high priority symbology is read, the scanner will read any barcode in its view (low priority or unspecified). If there is no barcode in the scanner's view after the time-out period expires, then no data is reported.

Note: *A low priority symbol must be centered on the aiming pattern to be read.*

Scan a barcode below to enable or disable Preferred Symbology. *Default = Preferred Symbology Off.*

PRFENA1.
Preferred Symbology On

PRFENA0.
* Preferred Symbology Off

High Priority Symbology

To specify the high priority symbology, scan the High Priority Symbology barcode below. On the Symbology Charts on page 211, find the symbology you want to set as high priority. Locate the Hex value for that symbology and scan the 2 digit hex value from the Programming Chart, beginning on page 222. Scan **Save** to save your selection. *Default = None*

PRFCOD.
High Priority Symbology

Low Priority Symbology

To specify the low priority symbology, scan the Low Priority Symbology barcode below. On the Symbology Charts on page 211, find the symbology you want to set as low priority. Locate the Hex value for that symbology and scan the 2 digit hex value from the Programming Chart, beginning on page 222.

If you want to set additional low priority symbologies, scan FF, then scan the 2 digit hex value from the Programming Chart for the next symbology. You can program up to 5 low priority symbologies. Scan **Save** to save your selection. *Default = None.*

PRFBLK.
Low Priority Symbology

Preferred Symbology Time-out

Once you have enabled Preferred Symbology and entered the high and low priority symbologies, you must set the time-out period. This is the period of time the scanner will search for a high priority barcode after a low priority barcode has been encountered. Scan the barcode below, then set the delay (from 1-3,000 milliseconds) by scanning digits from the Programming Chart, beginning on page 222, then scanning **Save**. *Default = 500 ms.*

PRFPTO.

Preferred Symbology Time-out

Preferred Symbology Default

Scan the barcode below to set all Preferred Symbology entries to their default values.

PRFDFT.

Preferred Symbology Default

Output Sequence Overview

Output Sequence Editor

This programming selection allows you to program the scanner to output data (when scanning more than one symbol) in whatever order your application requires, regardless of the order in which the barcodes are scanned. Reading the **Default Sequence** symbol programs the scanner to the Universal values, shown below. These are the defaults. Be certain you want to delete or clear all formats before you read the **Default Sequence** symbol.

Note: *To make Output Sequence Editor selections, you'll need to know the code I.D., code length, and character match(es) your application requires. Use the Alphanumeric symbols from the Programming Chart, beginning on page 222. You must hold the trigger while reading each barcode in the sequence.*

To Add an Output Sequence

1. Scan the *Enter Sequence* symbol (see Require Output Sequence, page 57).

2. **Code I.D.**
   On the Symbology Charts on page 211, find the symbology to which you want to apply the output sequence format. Locate the Hex value for that symbology

and scan the 2 digit hex value from the Programming Chart, beginning on page 222.

3. **Length**
   Specify what length (up to 9999 characters) of data output will be acceptable for this symbology. Scan the four digit data length from the Programming Chart, beginning on page 222. (Note: 50 characters is entered as 0050. 9999 is a universal number, indicating all lengths.) When calculating the length, you must count any programmed prefixes, suffixes, or formatted characters as part of the length (unless using 9999).

4. **Character Match Sequences**
   On the ASCII Conversion Chart (Code Page 1252) on page 214, find the Hex value that represents the character(s) you want to match. Use the Programming Chart, beginning on page 222, to read the alphanumeric combination that represents the ASCII characters. (99 is the Universal number, indicating all characters.)

5. **End Output Sequence Editor**
   Scan **F F** to enter an Output Sequence for an additional symbology, or **Save** to save your entries.

Other Programming Selections

Discard exits without saving any Output Sequence changes.

Output Sequence Example

In this example, you are scanning Code 93, Code 128, and Code 39 barcodes, but you want the scanner to output Code 39 1st, Code 128 2nd, and Code 93 3rd, as shown below.

Note: *Code 93 must be enabled to use this example.*

A – Code 39

B – Code 128

C – Code 93

You would set up the sequence editor with the following command line:

SEQBLK62999941FF6A999942FF69999943FF

The breakdown of the command line is shown below:

SEQBLK   sequence editor start command

62	code identifier for **Code 39**
9999	code length that must match for Code 39, 9999 = all lengths
41	start character match for Code 39, 41h = "A"
FF	termination string for first code
6A	code identifier for **Code 128**
9999	code length that must match for Code 128, 9999 = all lengths
42	start character match for Code 128, 42h = "B"
FF	termination string for second code
69	code identifier for **Code 93**
9999	code length that must match for Code 93, 9999 = all lengths
43	start character match for Code 93, 43h = "C"
FF	termination string for third code

To program the previous example using specific lengths, you would have to count any programmed prefixes, suffixes, or formatted characters as part of the length. If you use the example on , but assume a <CR> suffix and specific code lengths, you would use the following command line:

SEQBLK62001241FF6A001342FF69001243FF

The breakdown of the command line is shown below:

SEQBLK	sequence editor start command
62	code identifier for **Code 39**
0012	A – Code 39 sample length (11) plus CR suffix (1) = 12
41	start character match for Code 39, 41h = "A"
FF	termination string for first code
6A	code identifier for **Code 128**
0013	B – Code 128 sample length (12) plus CR suffix (1) = 13
42	start character match for Code 128, 42h = "B"
FF	termination string for second code
69	code identifier for **Code 93**
0012	C – Code 93 sample length (11) plus CR suffix (1) = 12
43	start character match for Code 93, 43h = "C"
FF	termination string for third code

Output Sequence Editor

‖‖‖‖‖‖‖‖‖‖‖‖‖
SEQBLK.
Enter Sequence

‖‖‖‖‖‖‖‖‖‖‖‖‖
SEQDFT.
Default Sequence

Partial Sequence

If an output sequence operation is terminated before all your output sequence criteria are met, the barcode data acquired to that point is a "partial sequence."

Scan Discard Partial Sequence to discard partial sequences when the output sequence operation is terminated before completion. Scan Transmit Partial Sequence to transmit partial sequences. (Any fields in the sequence where no data match occurred will be skipped in the output.)

‖‖‖‖‖‖‖‖‖‖‖‖‖
SEQTTS1.
Transmit Partial Sequence

‖‖‖‖‖‖‖‖‖‖‖‖‖
SEQTTS0.
* Discard Partial Sequence

Require Output Sequence

When an output sequence is Required, all output data must conform to an edited sequence or the scanner will not transmit the output data to the host device. When it's On/Not Required, the scanner will attempt to get the output data to conform to an edited sequence but, if it cannot, the scanner transmits all output data to the host device as is.

When the output sequence is Off, the barcode data is output to the host as the scanner decodes it. *Default = Off.*

Note: *This selection is unavailable when the Multiple Symbols Selection is turned On.*

‖‖‖‖‖‖‖‖‖‖‖‖‖
SEQ_EN2.
Required

||||||||||||||||||||||||
SEQ_EN1.
On/Not Required

||||||||||||||||||||||||
SEQ_EN0.
*Off

Multiple Symbols

When this programming selection is turned On, it allows you to read multiple symbols with a single push of the scanner's button. If you push and hold the button, aiming the scanner at a series of symbols, it reads unique symbols once, beeping (if turned On) for each read. The scanner attempts to find and decode new symbols as long as the button is pushed. When this programming selection is turned Off, the scanner will only read the symbol closest to the aiming beam. *Default = Off.*

||||||||||||||||||||||||
SHOTGN1.
On

||||||||||||||||||||||||
SHOTGN0.
* Off

No Read

With No Read turned On, the scanner notifies you if a code cannot be read. If using an EZConfig Tool Scan Data Window (see page), an "NR" appears when a code cannot be read. If No Read is turned Off, the "NR" will not appear. *Default = Off.*

||||||||||||||||||||||||
SHWNRD1.
On

||||||||||||||||||||||||
SHWNRD0.
* Off

If you want a different notation than "NR," for example, "Error," or "Bad Code," you can edit the output message 0. The hex code for the No Read symbol is 9C.

Video Reverse

Video Reverse is used to allow the scanner to read barcodes that are inverted. The Video Reverse Off barcode below is an example of this type of barcode. Scan Video Reverse Only to read *only* inverted barcodes. Scan Video Reverse and Standard Barcodes to read both types of codes.

Note: *After scanning Video Reverse Only, menu barcodes cannot be read. You must scan Video Reverse Off or Video Reverse and Standard Barcodes in order to read menu barcodes.*

Note: *Images downloaded from the unit are not reversed. This is a setting for decoding only.*

VIDREV1.

Video Reverse Only

VIDREV2

Video Reverse and Standard Barcodes

VIDREV0.

* Video Reverse Off

Working Orientation

Some barcodes are direction-sensitive. For example, KIX codes and OCR can misread when scanned sideways or upside down. Use the working orientation settings if your direction-sensitive codes will not usually be presented upright to the scanner. *Default = Upright.*

Upright:

Upside Down:

Vertical, Top to Bottom:
(Rotate CW 90°)
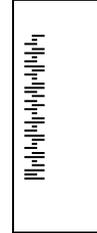

Vertical, Bottom to Top:
(Rotate CCW 90°)

ROTATN0.
* Upright

ROTATN1.

DATA EDITING

Prefix/Suffix Overview

When a barcode is scanned, additional information is sent to the host computer along with the barcode data. This group of barcode data and additional, user-defined data is called a "message string." The selections in this section are used to build the user-defined data into the message string.

Prefix and Suffix characters are data characters that can be sent before and after scanned data. You can specify if they should be sent with all symbologies, or only with specific symbologies. The following illustration shows the breakdown of a message string:

Prefix	Scanned Data	Suffix
1-11 alpha numeric & control characters	variable length	1-11 alpha numeric & control characters
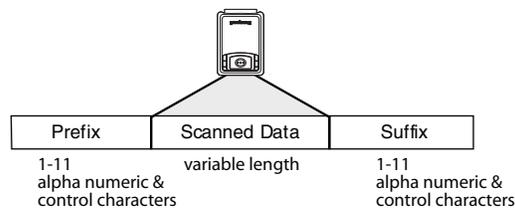

Points to Keep In Mind

- It is not necessary to build a message string. The selections in this chapter are only used if you wish to alter the default settings. *Default prefix = None. Default suffix = None.*

- A prefix or suffix may be added or cleared from one symbology or all symbologies.

- You can add any prefix or suffix from the ASCII Conversion Chart (Code Page 1252) on page 214, plus Code I.D. and AIM I.D.

- You can string together several entries for several symbologies at one time.

- Enter prefixes and suffixes in the order in which you want them to appear on the output.

- When setting up for specific symbologies (as opposed to all symbologies), the specific symbology ID value counts as an added prefix or suffix character.
- The maximum size of a prefix or suffix configuration is 200 characters, which includes header information.

To Add a Prefix or Suffix:

Step 1.   Scan the Add Prefix or Add Suffix symbol (see page 64).

Step 2.   Determine the 2 digit Hex value from the Symbology Chart (included in the Symbology Charts on page 211) for the symbology to which you want to apply the prefix or suffix. For example, for Code 128, Code ID is "j" and Hex ID is "6A".

Step 3.   Scan the 2 hex digits ffrom the Programming Chart, beginning on page 222, or scan 9, 9 for all symbologies.

Step 4.   Determine the hex value from the ASCII Conversion Chart (Code Page 1252) on page 214, for the prefix or suffix you wish to enter.

Note: *To add the Code I.D., scan 5, C, 8, 0.*
To add AIM I.D., scan 5, C, 8, 1.
To add a backslash (\), scan 5, C, 5, C.
To add a backslash (\), you must scan 5C twice – once to create the leading backslash and then to create the backslash itself.

Step 5.   Scan the 2 digit hex value from the Programming Chart, beginning on page 222.

Step 6.   Repeat Steps 4 and 5 for every prefix or suffix character.

Step 7.   Scan **Save** to exit and save, or scan **Discard** to exit without saving.

Repeat Steps 1–6 to add a prefix or suffix for another symbology.

Example: Add a Tab Suffix to All Symbologies

Step 1.   Scan Add Suffix.

Step 2.   Scan 9, 9 from the Programming Chart, beginning on page 222, to apply this suffix to all symbologies.

Step 3.   Scan 0, 9 from the Programming Chart, beginning on page 222. This corresponds with the hex value for a horizontal tab, shown in the ASCII Conversion Chart (Code Page 1252) on page 214.

Step 4.   Scan **Save**, or scan **Discard** to exit without saving.

To Clear One or All Prefixes or Suffixes

You can clear a single prefix or suffix, or clear all prefixes/suffixes for a symbology. If you have been entering prefixes and suffixes for single symbologies, you can use Clear One Prefix (Suffix) to delete a specific character from a symbology. When you Clear All Prefixes (Suffixes), all the prefixes or suffixes for a symbology are deleted.

Step 1.   Scan the Clear One Prefix or Clear One Suffix symbol.

Step 2.   Determine the 2 digit Hex value from the Symbology Chart (included in the Symbology Charts on page 211) for the symbology from which you want to clear the prefix or suffix.

Step 3.   Scan the 2 digit hex value from the Programming Chart, beginning on page 222, or scan 9, 9 for all symbologies.

Your change is automatically saved.

To Add a Carriage Return Suffix to All Symbologies

Scan the following barcode if you wish to add a carriage return suffix to all symbologies at once. This action first clears all current suffixes, then programs a carriage return suffix for all symbologies.

**Add CR Suffix
All Symbologies**

Function Code Transmit

When this selection is enabled and function codes are contained within the scanned data, the scanner transmits the function code to the terminal. Charts of these function codes are provided in ASCII Conversion Chart (Code Page 1252) on page 214 . When the scanner is in keyboard wedge mode, the scan code is converted to a key code before it is transmitted. *Default = Enable.*

RMVFNC0.
* Enable

RMVFNC1.
Disable

Intercharacter, Interfunction, and Intermessage Delays

Some terminals drop information (characters) if data comes through too quickly. Intercharacter, interfunction, and intermessage delays slow the transmission of data, increasing data integrity.

Intercharacter Delay

An intercharacter delay of up to 5000 milliseconds (in 5ms increments) may be placed between the transmission of each character of scanned data. Scan the Intercharacter Delay barcode below, then scan the number of 5ms delays, and the **Save** barcode using the Programming Chart, beginning on page 222.

Intercharacter Delay

DLYCHR.
Intercharacter Delay
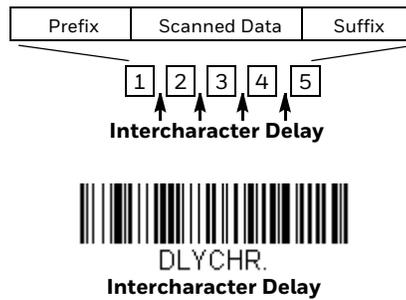

To remove this delay, scan the Intercharacter Delay barcode, then set the number of delays to 0. Scan the **Save** barcode using the Programming Chart, beginning on page 222.

Note: *Intercharacter delays are not supported in USB serial.*

User Specified Intercharacter Delay

An intercharacter delay of up to 5000 milliseconds (in 5ms increments) may be placed after the transmission of a particular character of scanned data. Scan the Delay Length barcode below, then scan the number of 5ms delays, and the **Save** barcode from the Programming Chart, beginning on page 222.

Next, scan the Character to Trigger Delay barcode, then the 2-digit hex value for a printable character to trigger the delay (see Symbology Charts on page 211).

DLYCRX.
Delay Length

DLY_XX.
Character to Trigger Delay

To remove this delay, scan the Delay Length barcode, and set the number of delays to 0. Scan the **Save** barcode from the Programming Chart, beginning on page 222.

Interfunction Delay

An interfunction delay of up to 5000 milliseconds (in 5ms increments) may be placed between the transmission of each control character in the message string. Scan the Interfunction Delay barcode below, then scan the number of 5ms delays, and the **Save** barcode from the Programming Chart, beginning on page 222.

Prefix	Scanned Data	Suffix

STX	1	HT	2	3	4	5	CR	LF

Interfunction Delays
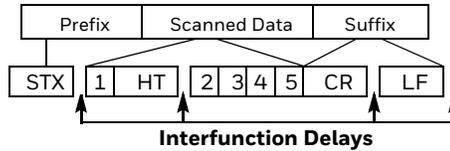

DLYFNC.
Interfunction Delay

To remove this delay, scan the Interfunction Delay barcode, then set the number of delays to 0. Scan the **Save** barcode using the Programming Chart, beginning on page 222.

Intermessage Delay

An intermessage delay of up to 5000 milliseconds (in 5ms increments) may be placed between each scan transmission. Scan the Intermessage Delay barcode below, then scan the number of 5ms delays, and the **Save** barcode from the Programming Chart, beginning on page 222.

1st Scan Transmission **2nd Scan Transmission**
Intermessage Delay
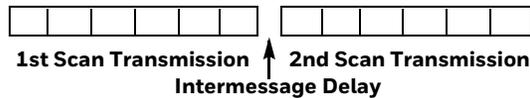

DLYMSG.
Intermessage Delay

To remove this delay, scan the Intermessage Delay barcode, then set the number of delays to 0. Scan the **Save** barcode from the Programming Chart, beginning on page 222.

5 DATA FORMATTING

Data Format Editor Introduction

You may use the Data Format Editor to change the scanner's output. For example, you can use the Data Format Editor to insert characters at certain points in barcode data as it is scanned. The selections in the following pages are used only if you wish to alter the output. *Default Data Format setting = None.*

Normally, when you scan a barcode, it is output automatically. However, when you create a format, you must use a "send" command (see Send Commands on page 70) within the format program to output data.

Multiple formats may be programmed into the scanner. They are stacked in the order in which they are entered. However, the following list presents the order in which formats are applied:

1. Specific Terminal ID, Actual Code ID, Actual Length
2. Specific Terminal ID, Actual Code ID, Universal Length
3. Specific Terminal ID, Universal Code ID, Actual Length
4. Specific Terminal ID, Universal Code ID, Universal Length
5. Universal Terminal ID, Actual Code ID, Actual Length
6. Universal Terminal ID, Actual Code ID, Universal Length
7. Universal Terminal ID, Universal Code ID, Actual Length
8. Universal Terminal ID, Universal Code ID, Universal Length

The maximum size of a data format configuration is 2000 bytes, which includes header information.

If a barcode is read that fails the first data format, the next data format, if there is one, will be used on the barcode data. If there is no other data format, the raw data is output.

If you have changed data format settings, and wish to clear all formats and return to the factory defaults, scan the Default Data Format code below.

DFMDF3.

* Default Data Format

Add a Data Format

Step 1. Scan the **Enter Data Format** symbol (see page 69).

Step 2. Select **Primary/Alternate Format**
Determine if this will be your primary data format, or one of 3 alternate formats. This allows you to save a total of 4 different data formats. To program your primary format, scan **0** from the Programming Chart, beginning on page 222. If you are programming an alternate format, scan **1, 2**, or **3**, depending on which alternate format you are programming. (see Primary/Alternate Data Formats on page 85 for further information.)

Step 3. **Terminal Type**
Refer to Terminal ID Table on page 70 and locate the Terminal ID number for your PC. Scan three numeric barcodes from the Programming Chart, beginning on page 222, to program the scanner for your terminal ID (you must enter 3 digits). For example, scan **0 0 3** for an AT wedge.

Note: **099** *indicates all terminal types.*

Step 4. **Code I.D.**
In the Symbology Charts on page 211, find the symbology to which you want to apply the data format. Locate the Hex value for that symbology and scan the 2 digit hex value from the Programming Chart, beginning on page 222.

If you wish to create a data format for all symbologies, with the exception of some specific symbologies, refer to B8 (see page 83).

If you are creating a data format for Batch Mode Quantity, use **35** for the Code I.D.

Note: **99** *indicates all symbologies.*

Step 5. **Length**
Specify what length (up to 9999 characters) of data will be acceptable for this symbology. Scan the four digit data length from the Programming Chart, beginning on page 222. For example, 50 characters is entered as **0050**.

Note: **9999** *indicates all lengths.*

Step 6. **Editor Commands**
Refer to Data Format Editor Commands on page 70. Scan the symbols that represent the command you want to enter.

Step 7.   Scan **Save** to save your data format, or **Discard** to exit without saving your changes.

```
DFMBK3.
```
Enter Data Format

```
MNUSAV.
```
Save

```
MNUABT.
```
Discard

Other Programming Selections

- **Clear One Data Format**
  This deletes one data format for one symbology. If you are clearing the primary format, scan **0** from the Programming Chart, beginning on page 222. If you are clearing an alternate format, scan **1, 2**, or **3**, depending on the format you are clearing. Scan the Terminal Type and Code I.D. (see Symbology Charts on page 211), and the barcode data length for the specific data format that you want to delete. All other formats remain unaffected.

- **Clear all Data Formats**
  This clears all data formats.

- **Save**
  Exit and save your data format changes.

- **Discard**
  Exit without saving any data format changes.

```
DFMCL3.
```
Clear One Data Format

```
DFMCA3.
```
Clear All Data Formats

```

Terminal ID Table

Terminal	Model(s)	Terminal ID
USB	PC keyboard (HID)	124
	Mac Keyboard	125
	PC Keyboard (Japanese)	134
	Serial (COM driver required)	130
	HID POS	131
	USB SurePOS Handheld	128
	USB SurePOS Tabletop	129
Serial	RS232 TTL	000
	RS232 True	000
	RS485 (IBM-HHBCR 1+2, 46xx)	051
Keyboard	PS2 compatibles	003
	AT compatibles	002

Data Format Editor Commands

When working with the Data Format Editor, a virtual cursor is moved along your input data string. The following commands are used to both move this cursor to different positions, and to select, replace, and insert data into the final output.

Send Commands

Send all characters

F1 Include in the output message all of the characters from the input message, starting from current cursor position, followed by an insert character. *Syntax = F1xx*, where xx stands for the insert character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Send a number of characters

F2 Include in the output message a number of characters followed by an insert character. Start from the current cursor position and continue for "nn" characters or through the last character in the input message, followed by character "xx." *Syntax = F2nnxx*, where nn stands for the numeric value (00-99) for the number of characters, and xx stands for the insert character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

F2 Example: Send a number of characters

||||||| ||| ||| |||||||| ||| ||| ||| ||| |||||| |||
1234567890ABCDEFGHIJ

Send the first 10 characters from the barcode above, followed by a carriage return. Command string: F2100D

F2 is the "Send a number of characters" command

10 is the number of characters to send

0D is the hex value for a CR

The data is output as: **1234567890**

F2 and F1 Example: Split characters into 2 lines

Send the first 10 characters from the barcode above, followed by a carriage return, followed by the rest of the characters.

Command string: **F2100DF10D**

F2 is the "Send a number of characters" command

10 is the number of characters to send for the first line

0D is the hex value for a CR

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
1234567890
ABCDEFGHIJ
<CR>

Send all characters up to a particular character

F3 Include in the output message all characters from the input message, starting with the character at the current cursor position and continuing to, but not including, the search character "ss," followed by an insert character. The cursor is moved forward to the "ss" character. *Syntax = F3ssxx*, where ss stands for the search character's hex value for its ASCII code, and xx stands for the insert character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

F3 Example: Send all characters up to a particular character

||||||| ||| ||| |||||||| ||| ||| ||| ||| |||||| |||
1234567890ABCDEFGHIJ

Using the barcode above, send all characters up to but not including "D," followed by a carriage return.

Command string: **F3440D**

F3 is the "Send all characters up to a particular character" command

44 is the hex value for a 'D"

0D is the hex value for a CR

The data is output as:
1234567890ABC
<CR>

Send all characters up to a string

B9 Include in the output message all characters from the input message, starting with the character at the current cursor position and continuing to, but not including, the search string "s…s." The cursor is moved forward to the beginning of the "s…s" string. *Syntax = B9nnnns…s*, where nnnn stands for the length of the string, and s…s stands for the string to be matched. The string is made up of hex values for the characters in the string. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex and, character codes.

B9 Example: Send all characters up to a defined string

1234567890ABCDEFGHIJ

Using the barcode above, send all characters up to but not including "AB."

Command string: **B900024142**

B9 is the "Send all characters up to a string" command

0002 is the length of the string (2 characters)

41 is the hex value for A

42 is the hex value for B

The data is output as: **1234567890**

Send all but the last characters

E9 Include in the output message all but the last "nn" characters, starting from the current cursor position. The cursor is moved forward to one position past the last input message character included. *Syntax = E9nn*, where nn stands for the numeric value (00-99) for the number of characters that will not be sent at the end of the message.

Insert a character multiple times

F4 Send "xx" character "nn" times in the output message, leaving the cursor in the current position. *Syntax = F4xxnn*, where xx stands for the insert character's hex value for its ASCII code, and nn is the numeric value (00-99) for the number of times it should be sent. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

E9 and F4 Example: Send all but the last characters, followed by 2 tabs

1234567890ABCDEFGHIJ

Send all characters except for the last 8 from the barcode above, followed by 2 tabs.

Command string: **E908F40902**

E9 is the "Send all but the last characters" command

08 is the number of characters at the end to ignore

F4 is the "Insert a character multiple times" command

09 is the hex value for a horizontal tab

02 is the number of times the tab character is sent

The data is output as: **1234567890AB <tab><tab>**

Insert a string

BA Send "ss" string of "nn" length in the output message, leaving the cursor in the current position. *Syntax = BAnnnns...s*, where nnnn stands for the length of the string, and s...s stands for the string. The string is made up of hex values for the characters in the string. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

B9 and BA Example: Look for the string "AB" and insert 2 asterisks (**)

1234567890ABCDEFGHIJ

Using the barcode above, send all characters up to but not including "AB." Insert 2 asterisks at that point, and send the rest of the data with a carriage return after.

Command string: **B900024142BA00022A2AF10D**

B9 is the "Send all characters up to a string" command

0002 is the length of the string (2 characters)

41 is the hex value for A

42 is the hex value for B

BA is the "Insert a string" command

0002 is the length of the string to be added (2 characters)

2A is the hex value for an asterisk (*)

2A is the hex value for an asterisk (*)

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
1234567890**ABCDEFGHIJ
<CR>

Insert symbology name

B3 Insert the name of the barcode's symbology in the output message, without moving the cursor. Only symbologies with a Honeywell ID are included (see Symbology Charts on page 211). Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Insert barcode length

B4 Insert the barcode's length in the output message, without moving the cursor. The length is expressed as a numeric string and does not include leading zeros.

B3 and B4 Example: Insert the symbology name and length

1234567890ABCDEFGHIJ

Send the symbology name and length before the barcode data from the barcode above. Break up these insertions with spaces. End with a carriage return.

Command string: **B3F42001B4F42001F10D**

B3 is the "Insert symbology name" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of times the space character is sent

B4 is the "Insert barcode length" command

F4 is the "Insert a character multiple times" command

20 is the hex value for a space

01 is the number of times the space character is sent

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
Code128 20 1234567890ABCDEFGHIJ
<CR>

Insert key strokes

B5 Insert a key stroke or combination of key strokes. Key strokes are dependent on your keyboard (see Keyboard Key References on page 220). Any key can be inserted, including arrows and functions. *Syntax = 5CB5xxssnn*, where xx is the number of keys pressed (without key modifiers), ss is the key modifier from the table below, and nn is the key number from the Keyboard Key References on page 220.

Key Modifiers	Hex
No Key Modifier	00
Shift Left	01
Shift Right	02
Alt Left	04
Alt Right	08
Control Left	10
Control Right	20

- For example, B501021F inserts an "A" on a 104 key, U.S. style keyboard. B5 = the command, 01 = number of key press events (without the key modifier), 02 is the key modifier for Shift Right, and 1F is the "a" key. If a lower case "a" were to be inserted, B501001F would be entered.

If there are three keystrokes, the syntax would change from B5xxssnn for one keystroke to B5xxssnnssnnssnn. An example that would insert "abc" is as follows: B503001F00320030F833.

Note: *Key modifiers can be added together when needed. The sum is converted to hexadecimals.*

Example: Control Left+Shift Left = 17, converted to hexadecimal = 11.

Move Commands

Move the cursor forward a number of characters

F5 Move the cursor ahead "nn" characters from current cursor position.
Syntax = F5nn, where nn is the numeric value (00-99) for the number of characters the cursor should be moved ahead.

F5 Example: Move the cursor forward and send the data

1234567890ABCDEFGHIJ

Move the cursor forward 3 characters, then send the rest of the barcode data from the barcode above. End with a carriage return.

Command string: **F503F10D**

F5 is the "Move the cursor forward a number of characters" command

03 is the number of characters to move the cursor

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
4567890ABCDEFGHIJ
<CR>

Move the cursor backward a number of characters

F6 Move the cursor back "nn" characters from current cursor position.
Syntax = F6nn, where nn is the numeric value (00-99) for the number of characters the cursor should be moved back.

Move the cursor to the beginning

F7 Move the cursor to the first character in the input message. *Syntax = F7.*

FE and F7 Example: Manipulate barcodes that begin with a 1

1234567890ABCDEFGHIJ

Search for barcodes that begin with a 1. If a barcode matches, move the cursor back to the beginning of the data and send 6 characters followed by a carriage return. Using the barcode above:

Command string: **FE31F7F2060D**

FE is the "Compare characters" command

31 is the hex value for 1

F7 is the "Move the cursor to the beginning" command

F2 is the "Send a number of characters" command

06 is the number of characters to send

0D is the hex value for a CR

The data is output as:
123456
<CR>

Move the cursor to the end

EA Move the cursor to the last character in the input message. *Syntax = EA.*

Search Commands

Search forward for a character

F8 Search the input message forward for "xx" character from the current cursor position, leaving the cursor pointing to the "xx" character. *Syntax = F8xx*, where xx stands for the search character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

F8 Example: Send barcode data that starts after a particular character

1234567890ABCDEFGHIJ

Search for the letter "D" in barcodes and send all the data that follows, including the "D." Using the barcode above:

Command string: **F844F10D**

F8 is the "Search forward for a character" command

44 is the hex value for "D"

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
DEFGHIJ
<CR>

Search backward for a character

F9 Search the input message backward for "xx" character from the current cursor position, leaving the cursor pointing to the "xx" character. *Syntax = F9xx*, where xx stands for the search character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Search forward for a string

B0 Search forward for "s" string from the current cursor position, leaving cursor pointing to "s" string. *Syntax = B0nnnnS*, where nnnn is the string length (up to 9999), and S consists of the ASCII hex value of each character in the match string. For example, B00004546657374 will search forward for the first occurrence of the 4 character string "Test." Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

B0 Example: Send barcode data that starts after a string of characters

1234567890ABCDEFGHIJ

Search for the letters "FGH" in barcodes and send all the data that follows, including "FGH." Using the barcode above:

Command string: **B00003464748F10D**

B0 is the "Search forward for a string" command

0003 is the string length (3 characters)

46 is the hex value for "F"

47 is the hex value for "G"

48 is the hex value for "H"

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
FGHIJ
<CR>

Search backward for a string

B1 Search backward for "s" string from the current cursor position, leaving cursor pointing to "s" string. *Syntax = B1nnnnS*, where nnnn is the string length (up to 9999), and S consists of the ASCII hex value of each character in the match string. For example, B10004546657374 will search backward for the first occurrence of the 4 character string "Test." Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex and character codes.

Search forward for a non-matching character

E6 Search the input message forward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character. *Syntax = E6xx* where xx stands for the search character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex and character codes.

E6 Example: Remove zeros at the beginning of barcode data

||||||||||||||||||||||||||||
J00037692

This example shows a barcode that has been zero filled. You may want to ignore the zeros and send all the data that follows. E6 searches forward for the first character that is not zero, then sends all the data after, followed by a carriage return. Using the barcode above:

Command string: **E630F10D**

E6 is the "Search forward for a non-matching character" command

30 is the hex value for 0

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
37692
<CR>

Search backward for a non-matching character

E7 Search the input message backward for the first non-"xx" character from the current cursor position, leaving the cursor pointing to the non-"xx" character. *Syntax = E7xx*, where xx stands for the search character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Miscellaneous Commands

Suppress characters

FB Suppress all occurrences of up to 15 different characters, starting at the current cursor position, as the cursor is advanced by other commands. When the FC command is encountered, the suppress function is terminated. The cursor is not moved by the FB command. *Syntax = FBnnxxyy . .zz*, where nn is a count of the number of suppressed characters in the list, and xxyy .. zz is the list of characters to be suppressed.

FB Example: Remove spaces in barcode data

|||||||||||||||||||||||||||||||
345 678 90

This example shows a barcode that has spaces in the data. You may want to remove the spaces before sending the data. Using the barcode above:

Command string: **FB0120F10D**

FB is the "Suppress characters" command

01 is the number of character types to be suppressed

20 is the hex value for a space

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:
34567890
<CR>

Stop suppressing characters

FC Disables suppress filter and clear all suppressed characters. *Syntax = FC.*

Replace characters

E4 Replaces up to 15 characters in the output message, without moving the cursor. Replacement continues until the E5 command is encountered. *Syntax = E4nnxx$_1$xx$_2$yy$_1$yy$_2$...zz$_1$zz$_2$*, where nn is the total count of the number of characters in the list (characters to be replaced plus replacement characters); xx$_1$ defines characters to be replaced and xx$_2$ defines replacement characters, continuing through zz$_1$ and zz$_2$.

E4 Example: Replace zeros with CRs in barcode data

1234056780ABC

If the barcode has characters that the host application does not want included, you can use the E4 command to replace those characters with something else. In this example, you will replace the zeros in the barcode above with carriage returns.

Command string: **E402300DF10D**

E4 is the "Replace characters" command

02 is the total count of characters to be replaced, plus the replacement characters (0 is replaced by CR, so total characters = 2)

30 is the hex value for 0

0D is the hex value for a CR (the character that will replace the 0)

F1 is the "Send all characters" command

0D is the hex value for a CR

The data is output as:

1234
5678
ABC
<CR>

Stop replacing characters

E5 Terminates character replacement. *Syntax = E5.*

Compare characters

FE Compare the character in the current cursor position to the character "xx." If characters are equal, move the cursor forward one position. *Syntax = FExx,* where xx stands for the comparison character's hex value for its ASCII code. Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Compare string

B2 Compare the string in the input message to the string "s." If the strings are equal, move the cursor forward past the end of the string. *Syntax = B2nnnnS,* where nnnn is the string length (up to 9999), and S consists of the ASCII hex value of each character in the match string. For example, B2000454657374 will compare the string at the current cursor position with the 4 character string "Test." Refer to the ASCII Conversion Chart (Code Page 1252) on page 214 for decimal, hex, and character codes.

Check for a number

EC Check to make sure there is an ASCII number at the current cursor position. The format is aborted if the character is not numeric.

EC Example: Only output the data if the barcode begins with a number

If you want only data from barcodes that begin with a number, you can use EC to check for the number.

Command string: **ECF10D**

EC is the "Check for a number" command

F1 is the "Send all characters" command

0D is the hex value for a CR

If this barcode is read, the next data format, if there is one, will

be used on the data. If there is no other format, the format fails and the raw data is output as **AB1234**.

If this barcode is read, the data is output as:

1234AB
<CR>

Check for non-numeric character

ED Check to make sure there is a non-numeric ASCII character at the current cursor position. The format is aborted if the character is numeric.

ED Example: Only output the data if the barcode begins with a letter

If you want only data from barcodes that begin with a letter, you can use ED to check for the letter.

Command string: **EDF10D**

ED is the "Check for a non-numeric character" command

F1 is the "Send all characters" command

0D is the hex value for a CR

If this barcode is read, the next data format, if there is one, will

be used on this data. If there is no other format, the format fails and the raw data is output as **1234AB**.

If this barcode is read, the data is output as:

AB1234
<CR>

Insert a delay

EF Inserts a delay of up to 49,995 milliseconds (in multiples of 5), starting from the current cursor position. *Syntax = EFnnnn*, where nnnn stands for the delay in 5ms increments, up to 9999. This command can only be used with keyboard emulation.

Discard Data

B8 Discards types of data. For example, you may want to discard Code 128 barcodes that begin with the letter A. In step 4 (page 68), select 6A (for Code 128), and in step 5, select 9999 (for all lengths). Enter FE41B8 to compare and discard Code 128 barcodes that begin with the letter A. *Syntax = B8.*

Note: *The B8 command must be entered after all other commands.*
*The Data Format must be **Required** (see page 83) in order for the B8 command to work.*
If Data Format is On, but Not Required (page 84), barcode data that meets the B8 format is scanned and output as usual.
*Because the data format needs to be **On** and **Required** (page 84) for the B8 command, you must input data formats for all barcodes you wish to discard as well as all barcodes you wish to output.*
Other data format settings impact the B8 command. If Data Format Non-Match Error Tone is On (page 84), the scanner emits an error tone. If Data format Non-Match Error Tone is Off, the code is disabled for reading and no tone is sounded.

Data Formatter

When Data Formatter is turned Off, the barcode data is output to the host as read, including prefixes and suffixes.

DFM_EN0.
Data Formatter Off

You may wish to require the data to conform to a data format you have created and saved. The following settings can be applied to your data format:

- **Data Formatter On, Not Required, Keep Prefix/Suffix**
  Scanned data is modified according to your data format, and prefixes and suffixes are transmitted.

- **Data Formatter On, Not Required, Drop Prefix/Suffix**
  Scanned data is modified according to your data format. If a data format is found for a particular symbol, those prefixes and suffixes are not transmitted. If a data format is *not* found for that symbol, the prefixes and suffixes *are* transmitted.

- **Data Format Required, Keep Prefix/Suffix**
  Scanned data is modified according to your data format, and prefixes and suffixes are transmitted. Any data that does not match your data format requirements generates an error tone and the data in that barcode is not transmitted. If you wish to process this type of barcode without generating an error tone, see Data Format Non-Match Error Tone on page 84.

- **Data Format Required, Drop Prefix/Suffix**
  Scanned data is modified according to your data format. If a data format is

found for a particular symbol, those prefixes and suffixes are not transmitted. Any data that does not match your data format requirements generates an error tone. If you wish to process this type of barcode without generating an error tone, see Data Format Non-Match Error Tone on page 84.

Choose one of the following options. *Default = Data Formatter On, Not Required, Keep Prefix/Suffix*

DFM_EN1.

*** Data Formatter On,
Not Required,
Keep Prefix/Suffix**

DFM_EN3.

**Data Formatter On,
Not Required,
Drop Prefix/Suffix**

DFM_EN2.

**Data Format Required,
Keep Prefix/Suffix**

DFM_EN4.

**Data Format Required,
Drop Prefix/Suffix**

Data Format Non-Match Error Tone

When a barcode is encountered that doesn't match your required data format, the scanner normally generates an error tone. However, you may want to continue scanning barcodes without hearing the error tone. If you scan the **Data Format Non-Match Error Tone Off** barcode, data that doesn't conform to your data format is not transmitted, and no error tone will sound. If you wish to hear the error tone when a non-matching barcode is found, scan the **Data Format Non-Match Error Tone On** barcode. *Default = Data Format Non-Match Error Tone On*.

DFMDEC0.

*** Data Format Non-Match Error
Tone On**

DFMDEC1.

**Data Format Non-Match
Error Tone Off**

Primary/Alternate Data Formats

You can save up to four data formats and switch between these formats. Your primary data format is saved under **0**. Your other three formats are saved under **1**, **2**, and **3**. To set your device to use one of these formats, scan one of the barcodes below.

ALTFNM0.

Primary Data Format

ALTFNM1.

Data Format 1

ALTFNM2.

Data Format 2

ALTFNM3.

Data Format 3

Single Scan Data Format Change

You can also switch between data formats for a single scan. The next barcode is scanned using an alternate data format, then reverts to the format you have selected above (either Primary, 1, 2, or 3).

For example, you may have set your device to the data format you saved as Data Format 3. You can switch to Data Format 1 for a single trigger pull by scanning the **Single Scan–Data Format 1** barcode below. The next barcode that is scanned uses Data Format 1, then reverts back to Data Format 3.

VSAF_0.

Single Scan–Primary Data Format

VSAF_1.

Single Scan–Data Format 1

VSAF_2.

Single Scan–Data Format 2

||| ||||| || ||||| ||| |||||
VSAF_3.
Single Scan-Data Format 3

EXTERNAL INPUT / OUTPUT

The Vuquest 3320 scanner can be integrated with a variety of third party devices. The External Trigger and Illumination Controls can be configured using the barcodes in this chapter. These controls offer simple trigger signals. An External I/O license and cable are required; contact the nearest technical support office for further information (see Technical Assistance on page xiii).

External Input

External Trigger Control

The External Trigger Control allows object detection from the third party device to trigger the scanner. If you want to use the third party device object detection, scan the External Trigger Control On barcode. If you want to use the 3320 scanner object detection, scan the External Trigger Control Off barcode. *Default = External Trigger Control Off*.

EXTTRG0.

* External Trigger Control Off

EXTTRG1.

External Trigger Control On

External Trigger Polarity

External Trigger Polarity has two states, High and Low. A digital high polarity is 1 and a digital low polarity is 0. If the third party device triggers on low polarity, 0, scan the External Trigger Polarity Low barcode. *Default = External Trigger Polarity High*.

EXTTPO1.

* External Trigger Polarity High

EXTTPO0.

External Trigger Polarity Low

External Trigger Parameters

Absolute Maximum		
Maximum Input Voltage	Low Value: -0.5 Volts High Value: +5.5 Volts	The input is protected by an input protection diode on the ground side. The input voltage can be below ground provided it is current limited below the value shown on the next line of this table.
Maximum Input Current	Low Value: -6 Milliamperes	Input protection diode current. The limiting factor on current is the dissipation in the 1KΩ, 0402 resistor (not the gate diode limit).
Parameter Values		
Input Resistance to Ground	Low Value: 9.7 KΩ Nominal Value: 10.0 KΩ High Value: 10.3 KΩ	Pull down resistor loading.
Maximum Input Low Voltage Logical Low Level	High Value: 0.8 Volts	Value does not include harness drops or margin for noise.
Input High Voltage Threshold	Low Value: 2.6 Volts	Value does not include harness drops or margin for noise.

External Trigger Schematic
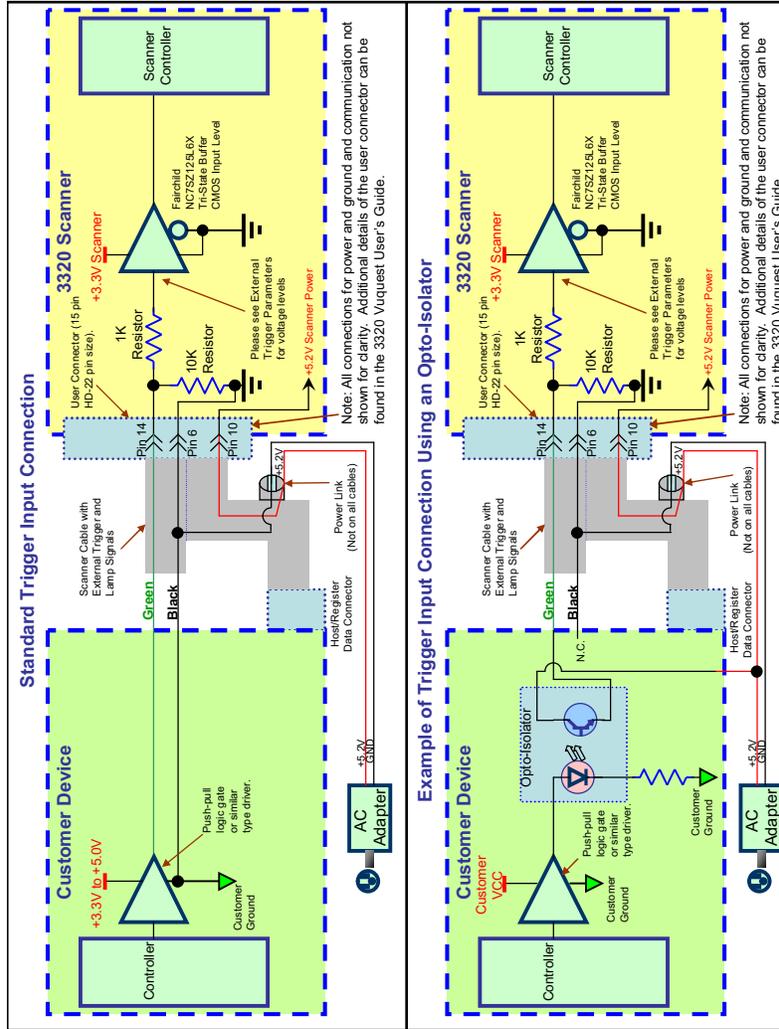

External Output

External Illumination Control

The External Illumination Control allows the third party device to use external illumination, supplemental to the illumination from the scanner. If the illumination will be provided by the third party device, scan the External Illumination Control On barcode. *Default = External Illumination Control Off.*

* External Illumination Control Off

External Illumination Parameters

Absolute Maximum		
Maximum voltage on output pin with scanner powered down.	High Value: 6 Volts	This allows a pull-up to be connected to this line provided it does not exceed the current on the next line of this table while operating.
Maximum current driven into pin from external source.	High Value: 5mA	Maximum current limited by series resistor dissipation.
Parameter Values		
Output Low Voltage Iout = 500uA	High Value: 0.6 Volts	Internal one-hundred ohm series resistor drop included.
Output Low Voltage Iout = 1mA	High Value: 0.7 Volts	
Output Low Voltage Iout = 4mA	High Value: 1.0 Volts	
Output Low Voltage Iout = 6mA	High Value: 1.2 Volts	
Output High Voltage Iout = -500uA	Low Value: 3.6 Volts	
Output High Voltage Iout = -1mA	Low Value: 3.5 Volts	
Output High Voltage Iout = -4mA	Low Value: 3.3 Volts	
Output High Voltage Iout = -6mA	Low Value: 3.1 Volts	

External Illumination Schematic
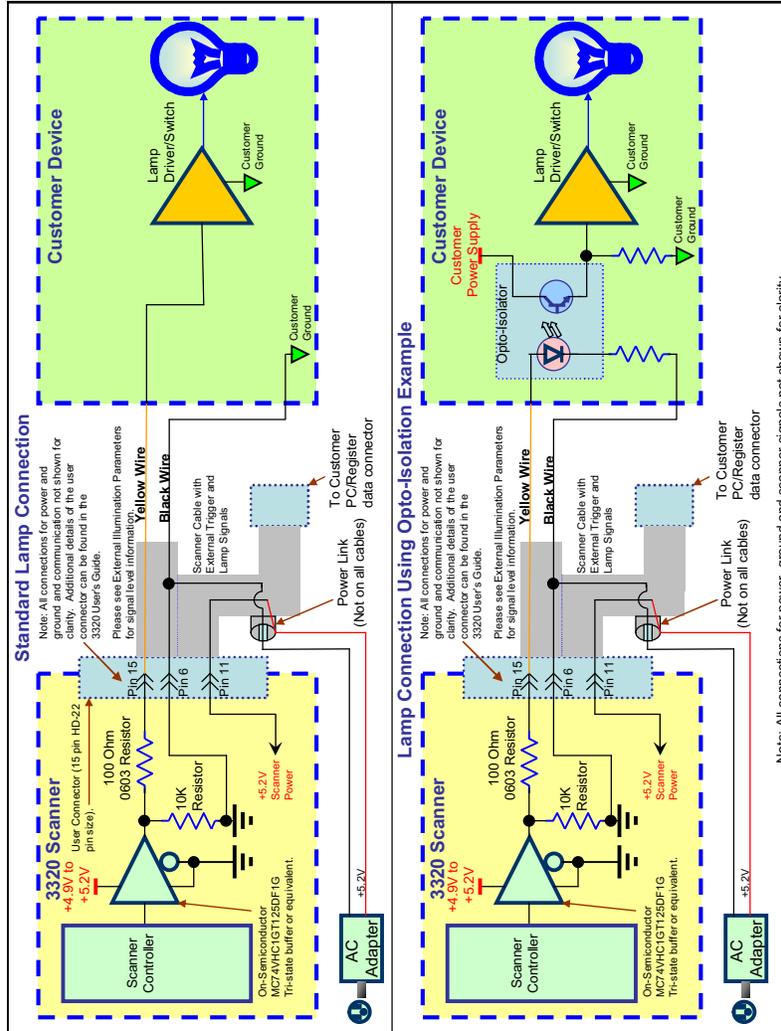

SYMBOLOGIES

This programming section contains the following menu selections. Refer to Chapter 10 for settings and defaults.

- All Symbologies
- Aztec Code
- China Post (Hong Kong 2 of 5)
- Chinese Sensible (Han Xin) Code
- Codabar
- Codablock A
- Codablock F
- Code 11
- Code 128
- Code 32 Pharmaceutical (PARAF)
- Code 39
- Code 93
- Data Matrix
- EAN/JAN-8
- EAN/JAN-13
- GS1 Composite Codes
- GS1 DataBar Expanded
- GS1 DataBar Limited
- GS1 DataBar Omnidirectional
- GS1 Emulation
- GS1-128
- Interleaved 2 of 5

- Korea Post
- Matrix 2 of 5
- MaxiCode
- MicroPDF417
- MSI
- NEC 2 of 5
- Postal Codes - 2D
- Postal Codes - Linear
- PDF417
- QR Code
- Straight 2 of 5 IATA (two-bar start/stop)
- Straight 2 of 5 Industrial (three-bar start/stop)
- TCIF Linked Code 39 (TLC39)
- Telepen
- Trioptic Code
- UPC-A
- UPC-A/EAN-13 with Extended Coupon Code
- UPC-E0
- UPC-E1

All Symbologies

If you want to decode all the symbologies allowable for your scanner, scan the *All Symbologies On* code. If on the other hand, you want to decode only a particular symbology, scan All Symbologies Off followed by the On symbol for that particular symbology.

Note: *Scanner performance may reduce by scanning All Symbologies On. Only scan All Symbologies On when needed.*

All Symbologies On

All Symbologies Off

Note: *When All Symbologies On is scanned, 2D Postal Codes are not enabled. 2D Postal Codes must be enabled separately.*

Message Length Description

You are able to set the valid reading length of some of the barcode symbologies. You may wish to set the same value for minimum and maximum length to force the scanner to read fixed length barcode data. This helps reduce the chances of a misread.

Example: Decode only those barcodes with a count of 9-20 characters.
Min. length = 09
Max. length = 20

Example: Decode only those barcodes with a count of 15 characters.
Min. length = 15
Max. length = 15

For a value other than the minimum and maximum message length defaults, scan the barcodes included in the explanation of the symbology, then scan the digit value of the message length and Save barcodes from the Programming Chart, beginning on page 222. The minimum and maximum lengths and the defaults are included with the respective symbologies.

Codabar

CBRDFT.

Codabar On/Off

CBRENA1.
* On

CBRENA0.
Off

Codabar Start / Stop Characters

Start/Stop characters identify the leading and trailing ends of the barcode. You may either transmit, or not transmit Start/Stop characters. *Default = Don't Transmit*.

CBRSSX1.
Transmit

CBRSSX0.
* Don't Transmit

Codabar Check Character

Codabar check characters are created using different "modulos." You can program the scanner to read only Codabar barcodes with Modulo 16 check characters. *Default = No Check Character*.

No Check Character indicates that the scanner reads and transmits barcode data with or without a check character.

When Check Character is set to *Validate and Transmit*, the scanner will only read Codabar barcodes printed with a check character, and will transmit this character at the end of the scanned data.

When Check Character is set to *Validate, but Don't Transmit*, the unit will only read Codabar barcodes printed *with* a check character, but will not transmit the check character with the scanned data.

CBRCK20.
* No Check Character

CBRCK21.
**Validate Modulo 16, but
Don't Transmit**

CBRCK22.
**Validate Modulo 16
and Transmit**

Codabar Concatenation

Codabar supports symbol concatenation. When you enable concatenation, the scanner looks for a Codabar symbol having a "D" start character, adjacent to a symbol having a "D" stop character. In this case the two messages are concatenated into one with the "D" characters omitted.

A 1 2 3 4 D   D 5 6 7 8 A

Select Require to prevent the scanner from decoding a single "D" Codabar symbol without its companion. This selection has no effect on Codabar symbols without Stop/Start D characters.

CBRCCT1.
On

CBRCCT0.
* Off

CBRCCT2.
Require

Codabar Message Length

Scan the barcodes below to change the message length. Refer to Message Length Description on page 94 for additional information. Minimum and Maximum lengths = 2-60. Minimum Default = 4, Maximum Default = 60.

CBRMIN.

Minimum Message Length

CBRMAX.

Maximum Message Length

Code 39 Start / Stop Characters

Start/Stop characters identify the leading and trailing ends of the barcode. You may either transmit, or not transmit Start/Stop characters. *Default = Don't Transmit.*

C39SSX1.

Transmit

C39SSX0.

* Don't Transmit

Code 39 Check Character

No Check Character indicates that the scanner reads and transmits barcode data with or without a check character.

When Check Character is set to Validate, but Don't Transmit, the unit only reads Code 39 barcodes printed with a check character, but will not transmit the check character with the scanned data.

When Check Character is set to Validate and Transmit, the scanner only reads Code 39 barcodes printed with a check character, and will transmit this character at the end of the scanned data. *Default = No Check Character.*

C39CK20.
* No Check Character

C39CK21.
Validate, but Don't Transmit

C39CK22.
Validate and Transmit

Code 39 Message Length

Scan the barcodes below to change the message length. Refer to Message Length Description on page 94 for additional information. Minimum and Maximum lengths = 0–48. Minimum Default = 0, Maximum Default = 48.

C39MIN.
Minimum Message Length

C39MAX.
Maximum Message Length

Code 39 Append

This function allows the scanner to append the data from several Code 39 barcodes together before transmitting them to the host computer. When the scanner encounters a Code 39 barcode with the append trigger character(s), it buffers Code 39 barcodes until it reads a Code 39 barcode that does not have the append trigger. The data is then transmitted in the order in which the barcodes were read (FIFO). *Default = Off.*

C39APP1.
On

C39APP0.
* Off

Code 32 Pharmaceutical (PARAF)

Code 32 Pharmaceutical is a form of the Code 39 symbology used by Italian pharmacies. This symbology is also known as PARAF.

Note: *Trioptic Code (see page 127) must be turned Off while scanning Code 32 Pharmaceutical codes.*

C39B321.
On

C39B320.
* Off

If Full ASCII Code 39 decoding is enabled, certain character pairs within the barcode symbol will be interpreted as a single character. For example: $V will be decoded as the ASCII character SYN, and /C will be decoded as the ASCII character #. *Default = Off*.

NUL %U	DLE $P	SP SPACE	0 0	@ %V	P P	` %W	p +P
SOH $A	DC1 $Q	! /A	1 1	A A	Q Q	a +A	q +Q
STX $B	DC2 $R	" /B	2 2	B B	R R	b +B	r +R
ETX $C	DC3 $S	# /C	3 3	C C	S S	c +C	s +S

SO $N	RS %D	. .	> %I	N N	^ %N	n +N	~ %S
SI $O	US %E	/ /O	? %J	O O	_ %O	o +O	DEL %T

Character pairs /M and /N decode as a minus sign and period respectively. Character pairs /P through /Y decode as 0 through 9.

C39ASC1.

Full ASCII On

C39ASC0.

* Full ASCII Off

Code 39 Code Page

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the barcode being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, scan the barcode below, select the code page with which the barcodes were created (see Symbology Charts on page 211), and scan the value and the **Save** barcode from the Programming Chart, beginning on page 222. The data characters should then appear properly.

Check Digit

No Check Digit indicates that the scanner reads and transmits barcode data with or without a check digit.

When Check Digit is set to Validate, but Don't Transmit, the unit only reads Interleaved 2 of 5 barcodes printed with a check digit, but will not transmit the check digit with the scanned data.

When Check Digit is set to Validate and Transmit, the scanner only reads Interleaved 2 of 5 barcodes printed with a check digit, and will transmit this digit at the end of the scanned data. *Default = No Check Digit.*

Code 93 Append

This function allows the scanner to append the data from several Code 93 barcodes together before transmitting them to the host computer. When this function is enabled, the scanner stores those Code 93 barcodes that start with a space (excluding the start and stop symbols), and does not immediately transmit the data. The scanner stores the data in the order in which the barcodes are read, deleting the first space from each. The scanner transmits the appended data when it reads a Code 93 barcode that starts with a character other than a space. *Default = Off.*

Code 93 Code Page

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the barcode being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, scan the barcode below, select the code page with which the barcodes were created (see Symbology Charts on page 211), and scan the value and the **Save** barcode from the Programming Chart, beginning on page 222. The data characters should then appear properly.

ISBT 128 Concatenation

In 1994 the International Society of Blood Transfusion (ISBT) ratified a standard for communicating critical blood information in a uniform manner. The use of ISBT formats requires a paid license. The ISBT 128 Application Specification describes 1) the critical data elements for labeling blood products, 2) the current recommendation to use Code 128 due to its high degree of security and its space-efficient design, 3) a variation of Code 128 that supports concatenation of neighboring symbols, and 4) the standard layout for barcodes on a blood product label. Use the barcodes below to turn concatenation On or Off. *Default =Off.*

Minimum Message Length

Maximum Message Length

GS1 Emulation

The scanner can automatically format the output from any GS1 data carrier to emulate what would be encoded in an equivalent GS1-128 or GS1 DataBar symbol. GS1 data carriers include UPC-A and UPC-E, EAN-13 and EAN-8, ITF-14, GS1-128, and GS1-128 DataBar and GS1 Composites. (Any application that accepts GS1 data can be simplified since it only needs to recognize one data carrier type.)

If GS1-128 Emulation is scanned, all retail codes (U.P.C., UPC-E, EAN8, EAN13) are expanded out to 16 digits. If the AIM ID is enabled, the value will be the GS1-128 AIM ID,]C1 (see Symbology Charts on page 211).

If GS1 DataBar Emulation is scanned, all retail codes (U.P.C., UPC-E, EAN8, EAN13) are expanded out to 16 digits. If the AIM ID is enabled, the value will be the GS1-DataBar AIM ID,]*em* (see Symbology Charts on page 211).

If GS1 Code Expansion Off is scanned, retail code expansion is disabled, and UPC-E expansion is controlled by the UPC-E0 Expand (see page 117) setting. If the AIM ID is enabled, the value will be the GS1-128 AIM ID,]C1 (see Symbology Charts on page 211).

If EAN8 to EAN13 Conversion is scanned, all EAN8 barcodes are converted to EAN13 format.

Default = GS1 Emulation Off.

QR Code Append

This function allows the scanner to append the data from several QR Code barcodes together before transmitting them to the host computer. When the scanner encounters an QR Code barcode with the append trigger character(s), it buffers the number of QR Code barcodes determined by information encoded in those barcodes. Once the proper number of codes is reached, the data is output in the order specified in the barcodes. *Default = On.*

QR Code Page

QR Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the barcode being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, scan the barcode below, select the code page with which the barcodes were created (see Symbology Charts on page 211), and scan the value and the **Save** barcode from the Programming Chart, beginning on page 222. The data characters should then appear properly.

IMAGING COMMANDS

The scanner is like a digital camera in the way it captures, manipulates, and transfers images. The following commands allow you to alter the way the scanner performs these functions.

Single-Use Basis

Imaging Commands with their modifiers send instructions to the scanner on a single-use basis, and take effect for a single image capture. Once that capture is complete, the scanner reverts to its imaging default settings. If you want to permanently change a setting, you must use the serial default commands (see Serial Programming Commands on page 175). When the serial default command is used, that selection becomes the new, permanent setting for the scanner.

Command Syntax

Multiple modifiers and commands can be issued within one sequence. If additional modifiers are to be applied to the same command, just add the modifiers to that command. For example, to add 2 modifiers to the Image Snap command, such as setting the Imaging Style to 1P and the Wait for Trigger to 1T, you would enter IMGSNP1P1T.

Note: *After processing an image capture command (IMGSNP or IMGBOX), you must follow it with an IMGSHP command if you want to see it on your terminal.*

To add a command to a sequence, each new command is separated with a semicolon. For example, to add the Image Ship command to the above sequence, you would enter IMGSNP1P1T;IMGSHP.

The imaging commands are:

Image Snap - IMGSNP (page 150)

Image Ship - IMGSHP (page 153)

Intelligent Signature Capture - IMGBOX (page 162)

The modifiers for each of these commands follow the command description.

Note: *The images included with each command description are examples only. The results you achieve may be different from those included in this manual. The quality of the output you receive will vary depending on lighting, quality of the initial image/object being captured, and distance of the scanner from the image/object. To achieve a high quality image, it is recommended that you position your scanner 4-6" (10.2-15.2 cm) away from the image/object you are capturing.*

Step 1 - Take a Picture Using IMGSNP

Image Snap - IMGSNP

An image is taken whenever the hardware button is pushed, or when the Image Snap (IMGSNP) command is processed.

The image snap command has many different modifiers that can be used to change the look of the image in memory. Any number of modifiers may be appended to the IMGSNP command. For example, you can use the following command to snap an image, increase the gain, and have the beeper sound once the snap is complete: IMGSNP2G1B

IMGSNP Modifiers

P - Imaging Style

This sets the Image Snap style.

OP   Decoding Style. This processing allows a few frames to be taken until the exposure parameters are met. The last frame is then available for further use.

1P   Photo Style *(default).* This mimics a simple digital camera, and results in a visually optimized image.

2P   Manual Style. This is an advanced style that should only be used by an experienced user. It allows you the most freedom to set up the scanner, and has no auto-exposure.

B - Beeper

Causes a beep to sound after an image is snapped.

OB   No beep *(default)*

1B   Sounds a beep when the image is captured.

T - Wait for Trigger

Waits for a hardware button push before taking the image. This is only available when using Photo Style (1P).

OT   Takes image immediately *(default)*

1T   Waits for a button push, then takes the image

L - LED State

Determines if the LEDs should be On or Off, and when. Ambient illumination (0L) is preferred for taking pictures of color documents, such as ID cards. LED illumination (1L) is preferred when the scanner is handheld. LED State is not available when using Decoding Style (0P).

0L   LEDs Off *(default)*

1L   LEDs On

E - Exposure

Exposure is used in Manual Style only (2P), and allows you to set the exposure time. This is similar to setting a shutter speed on a camera. The exposure time determines how long the scanner takes to record an image. On a bright day, exposure times can be very short because plenty of light is available to help record an image. At nighttime, exposure time can increase dramatically due to the near absence of light. Units are 127 microseconds.
(Default = 7874 (Gen 6), 10000000 (Gen 7))

*n*E   Range: 1 – 7874 (Gen 6), 1 – 10000000 (Gen 7)

Note: *For more infomation about the Gen 6 and Gen 7 software revisions, see About Software Revisions on page 6.*

Example of Exposure at 7874E with fluorescent lighting: **Example of Exposure at 100E with fluorescent lighting:**
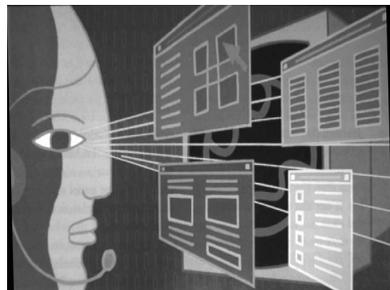

G - Gain

Gain is used in Manual Style only (2P). Like a volume control, the gain modifier boosts the signal and multiplies the pixel value. As you increase the gain, the noise in an image is also amplified.

1G   No gain *(default)*

2G   Medium gain

4G   Heavy gain

8G   Maximum gain

Example of Gain at 1G:	Example of Gain at 4G:	Example of Gain at 8G:

W - Target White Value

Sets the target for the median grayscale value in the captured image. For capturing close-up images of high contrast documents, a lower setting, such as 75, is recommended. Higher settings result in longer exposure times and brighter images, but if the setting is too high, the image may be overexposed. Target White Value is only available when using Photo Style (1P). *(Default = 125)*

*n*W   Range: 0 - 255

Example of White Value at 75W:	Example of White Value at 125W:	Example of White Value at 200W:

D - Delta for Acceptance

This sets the allowable range for the white value setting (see W - Target White Value). Delta is only available when using Photo Style (1P).
(Default = 25 (Gen 6), 30 (Gen 7))

Note: *For more infomation about the Gen 6 and Gen 7 software revisions, see About Software Revisions on page 6.*

*n*D   Range: 0 - 255

U – Update Tries

This sets the maximum number of frames the scanner should take to reach the D – Delta for Acceptance. Update Tries is only available when using Photo Style (1P). *(Default = 6)*

> *n*U   Range: 0 – 10

% – Target Set Point Percentage

Sets the target point for the light and dark values in the captured image. A setting of 75% means 75% of the pixels are at or below the target white value, and 25% of the pixels are above the target white value. Altering this setting from the default is not recommended under normal circumstances. To alter grayscale values, W – Target White Value should be used. *(Default = 50)*

> n%   Range: 1 – 99

Example of Target Set Point Percentage at 97%:	**Example of Target Set Point Percentage at 50%:**	**Example of Target Set Point Percentage at 40%:**
Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Curabitur massa. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Donec interdum volutpat arcu. Proin sed turpis. Donec	Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Curabitur massa. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Donec interdum volutpat arcu. Proin sed turpis. Donec	Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Curabitur massa. Lorem ipsum dolor sit amet, consectetuer adipiscing elit. Donec interdum volutpat arcu. Proin sed turpis. Donec

Step 2 – Ship a Picture Using IMGSHP

Image Ship – IMGSHP

An image is taken whenever the button is pushed, or when the Image Snap (IMGSNP) command is processed. The last image is always stored in memory. You can "ship" the image by using the IMGSHP command.

The image ship commands have many different modifiers that can be used to change the look of the image output. Modifiers affect the image that is transmitted, but do not affect the image in memory. Any number of modifiers may be appended to the IMGSHP command. For example, you can use the following command to snap and ship a bitmap image with gamma correction and document image filtering: IMGSNP;IMGSHP8F75K26U

IMGSHP Modifiers

A - Infinity Filter

Enhances pictures taken from very long distances (greater than 10 feet or 3m). The Infinity Filter should not be used with IMGSNP Modifiers (see page 150).

0A   Infinity filter Off *(default)*

1A   Infinity filter On

Example of Infinity Filter Off (0A) from approximately 12 feet (3.66m) away:
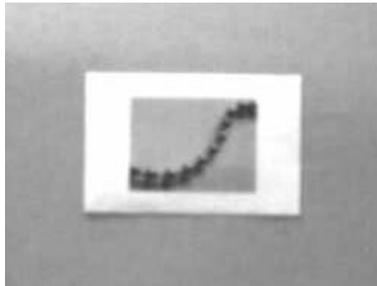

Example of Infinity Filter on (1A) from approximately 12 feet (3.66m) away:
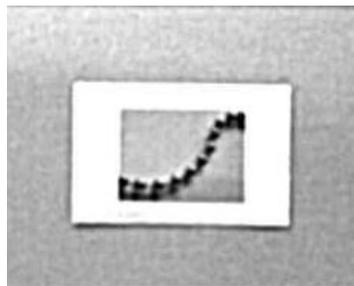

C - Compensation

Flattens the image to account for variations in illumination across the image.

0C   Compensation disabled *(default)*

1C   Compensation enabled

Example of Compensation at 0C: **Example of Compensation at 1C:**

D - Pixel Depth

Indicates the number of bits per pixel in the transmitted image (KIM or BMP format only).

8D   8 bits per pixel, grayscale image *(default)*

1D   1 bit per pixel, black and white image

E – Edge Sharpen

An edge sharpen filter cleans up the edges of an image, making it look cleaner and sharper. While edge sharpening does make the image look cleaner, it also removes some fine detail from the original image. The strength of the edge sharpen filter can be entered from 1 to 24. Entering a 23E gives the sharpest edges, but also increases noise in the image.

OE   Don't sharpen image *(default)*

14E   Apply edge sharpen for typical image

*n*e   Apply edge sharpen using strength *n* (*n* = 1–24)

Example of Edge Sharpen at 0E: **Example of Edge Sharpen at 24E:**
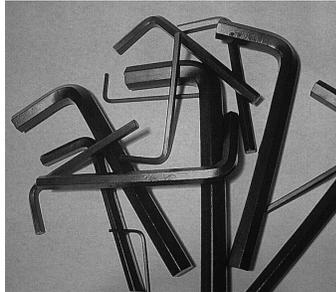

F – File Format

Indicates the desired format for the image.

OF   KIM format

1F   TIFF binary

2F   TIFF binary group 4, compressed

3F   TIFF grayscale

4F   Uncompressed binary (upper left to lower right, 1 pixel/bit, 0 padded end of line)

5F   Uncompressed grayscale (upper left to lower right, bitmap format)

6F   JPEG image *(default)*

8F   BMP format (lower right to upper left, uncompressed)

H - Histogram Stretch

Increases the contrast of the transmitted image. Not available with some image formats.

0H   No stretch *(default)*

1H   Histogram stretch

Example of Histogram Stretch at 0H: **Example of Histogram Stretch at 1H:**

I - Invert Image

Invert image is used to rotate the image around the X or Y axis.

1ix   Invert around the X axis (flips picture upside down)

1iy   Invert around the Y axis (flips picture left to right)

Example of image not inverted: **Example of image with Invert Image set to 1ix:**   **Example of image with Invert Image set to 1iy:**

IF– Noise Reduction

Used to reduce the salt and pepper noise in an image.

0if   No salt and pepper noise reduction (default)

1if   Salt and pepper noise reduction

Example of Noise Reduction Off (0if):   **Example of Noise Reduction On (1if):**
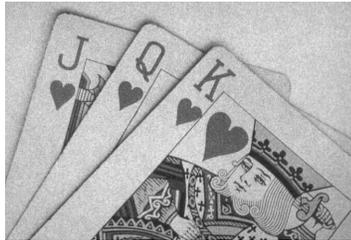

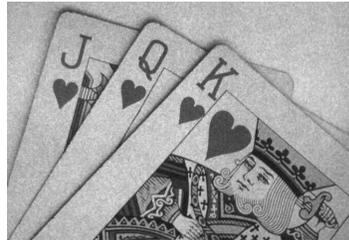

IR - Image Rotate

0ir   Image as snapped (rightside up) (default)

1ir   Rotate image 90 degrees to the right

2ir   Rotate image 180 degrees (upside down)

3ir   Rotate image 90 degrees to the left

Example of Image Rotate set to 0ir: **Example of Image Rotate set to 2ir:**

Example of Image Rotate set to 1ir: **Example of Image Rotate set to 3ir:**

J – JPEG Image Quality

Sets the desired quality when the JPEG image format is selected. Higher numbers result in higher quality, but larger files. Smaller numbers result in greater amounts of lossy compression, faster transmission times, lower quality, but smaller files. *(Default = 50)*

*n*J   Image is compressed as much as possible while preserving quality factor of *n* (*n* = 0 – 100)

0J   Worst quality (smallest file)

100J   Best quality (largest file)

K – Gamma Correction

Gamma measures the brightness of midtone values produced by the image. You can brighten or darken an image using gamma correction. A higher gamma correction yields an overall brighter image. The lower the setting, the darker the image. The optimal setting for text images is 50K.

0K   Gamma correction Off *(default)*

50K   Apply gamma correction for brightening typical document image

*n*K   Apply gamma correction factor *n* (*n* = 0–1,000)

Example of Gamma Correction set to 0K:

Example of Gamma Correction set to 50K:

Example of Gamma Correction set to 255K:

L, R, T, B, M – Image Cropping

Note: *Image Cropping should not be used with IMGSHP Modifiers (see page 154).*

Ships a window of the image by specifying the left, right, top, and bottom pixel coordinates. Device columns are numbered 0 through 1279, and device rows are numbered 0 through 959.

*n*L   The left edge of the shipped image corresponds to column *n* of the image in memory. Range: 000 – 843. *(Default = 0)*

*n*R   The right edge of the shipped image corresponds to column *n* – 1 of the image in memory. Range: 000 – 843. *(Default = all columns)*

*n*T   The top edge of the shipped image corresponds to row *n* of the image in memory. Range: 000 – 639. *(Default = 0)*

*n*B   The bottom edge of the shipped image corresponds to row *n* – 1 of the image in memory. Range: 000 – 639. *(Default = all rows)*

Uncropped Image: **Example of Image Crop set to 300R:** **Example of Image Crop set to 300L:**
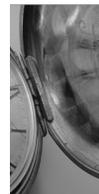

Example of Image Crop set to 200B: **Example of Image Crop set to 200T:**

Alternately, specify the number of pixels to cut from the outside margin of the image; thus only the center pixels are transmitted.

*n*M   Margin: cut *n* columns from the left, *n* + 1 columns from the right, *n* rows from the top, and *n* + 1 rows from the bottom of the image. Ship the remaining center pixels. Range: 0 – 238. *(Default = 0, or full image)*

Example of Image Crop set to 238M:

P - Protocol

Used for shipping an image. Protocol covers two features of the image data being sent to the host. It addresses the protocol used to send the data (Hmodem, which is an Xmodem 1K variant that has additional header information), and the format of the image data that is sent.

0P   None (raw data)

2P   None *(default for USB)*

3P   Hmodem compressed *(default for RS232)*

4P   Hmodem

S - Pixel Ship

Pixel Ship sizes an image in proportion to its original size. It decimates the image by shipping only certain, regularly spaced pixels. For example, 4S would transmit every fourth pixel from every fourth line. The smaller number of pixels shipped, the smaller the image, however, after a certain point the image becomes unusable.

1S   Ship every pixel *(default)*

2S   Ship every 2nd pixel, both horizontally and vertically

3S   Ship every 3rd pixel, both horizontally and vertically

Example of Pixel Ship set to 1S: **Example of Pixel Ship set to 2S:**   **Example of Pixel Ship set to 3S:**

U - Document Image Filter

Allows you to input parameters to sharpen the edges and smooth the area between the edges of text in an image. This filter should be used with gamma correction (see page 158), with the scanner in a stand, and the image captured using the command:

IMGSNP1P0L168W90%32D

This filter typically provides better JPEG compression than the standard E – Edge Sharpen command (see). This filter also works well when shipping pure black and white images (1 bit per pixel). The optimal setting is 26U.

0U Document image filter Off *(default)*

26U Apply document image filter for typical document image

*n*U Apply document image filter using grayscale threshold n. Use lower numbers when the image contrast is lower. 1U will have a similar effect to setting E – Edge Sharpen (see page 155) to 22e. Range: 0–255.

Example of Document Image Filter set to 0U:
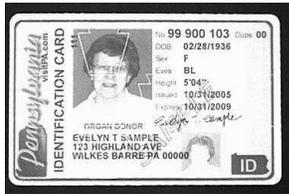

Example of Document Image Filter set to 26U:
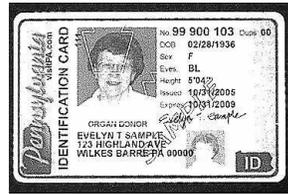

V – Blur Image

Smooths transitions by averaging the pixels next to the hard edges of defined lines and shaded areas in an image.

0V Don't blur *(default)*

1V Blur

Example of Blur Image Off (0V):

Example of Blur Image On (1V):

W - Histogram Ship

A histogram gives a quick picture of the tonal range of an image, or key type. A low-key image has detail concentrated in the shadows; a high-key image has detail concentrated in the highlights; and an average-key image has detail concentrated in the midtones. This modifier ships the histogram for an image.

0W   Don't ship histogram *(default)*

1W   Ship histogram

Image used for histogram: **Histogram of image at left:**
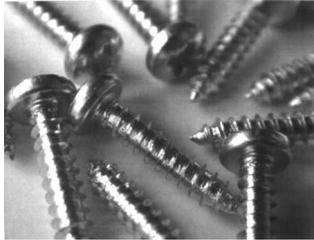

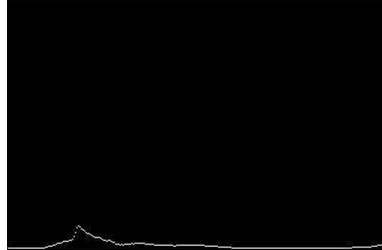

Image Size Compatibility

If you have applications that expect an image ship to return exactly 640x480 pixels, scan the Force VGA Resolution barcode. *Default = Native Resolution*.

IMGVGA1.

Force VGA Resolution

IMGVGA0.

* Native Resolution

Intelligent Signature Capture - IMGBOX

IMGBOX allows you to configure the size and location of a signature capture area relative to its proximity to a barcode. This allows you to tailor a signature capture area to a specific form. In order to use IMGBOX, you need a set form where the signature box location is in a known location relative to a barcode. You can input the overall size of the signature area, as well as specify how far the signature area is from the barcode, vertically and horizontally. You can also set the resolution and file format for the final output of the signature capture image.

Note: *IMGBOX commands can only be triggered by one of the following types of barcodes: PDF417, Code 39, Code 128, Aztec, Codabar, and Interleaved 2 of 5. Once one of these symbologies has been read, the image is retained for a possible IMGBOX command.*

Signature Capture Optimize

If you will be using your scanner to capture signatures frequently, you should optimize it for this purpose. However, the speed of scanning barcodes may be slowed when this mode is enabled. *Default = Off.*

DECBND1.

Optimize On

DECBND0.

* Optimize Off

Below is an example of a signature capture application. In this example, the aimer is centered over the signature capture area and the button is pushed. A single beep is emitted, indicating that the scanner has read a Code 128 barcode and the data has been transferred to the host. An IMGBOX command may now be sent from the host to specify the coordinates of the signature capture area below that code, and indicating that only that area containing the signature should be transferred as an image to the host.

To see this example, align the aimer with the signature area (not with the barcode), then push the button.

Signature Capture Area

Send the following IMGBOX command string after the button push:

Example: IMGBOX245w37h55y.

Note: *Case is not important in the command string. It is used here only for clarity.*

The following image is captured:
The IMGBOX commands have many different modifiers that can be used to change the size and appearance of the signature image output by the scanner. Modifiers affect the image that is transmitted, but do not affect the image in memory. Any number of modifiers may be appended to the IMGBOX command.

Note: *The IMGBOX command will return a NAK unless a window size (width and height) are specified. See H – Height of Signature Capture Area (page 165) and W – Width of Signature Capture Area (page 167).*

IMGBOX Modifiers

A - Output Image Width

This option is used to size the image horizontally. If using this option, set the resolution (R) to zero.

Example of Image Width set to 200A:
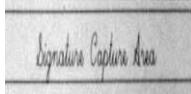

Example of Image Width set to 600A:
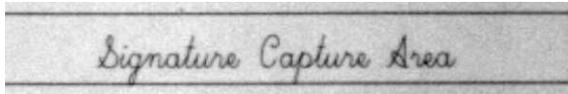

B - Output Image Height

This option is used to size the image vertically. If using this option, set the resolution (R) to zero.

Example of Image Height set to 50B:
Example of Image Height set to 100B:
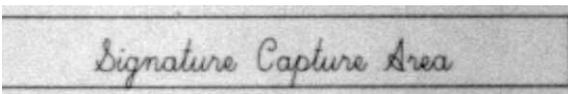

D - Pixel Depth

This indicates the number of bits per pixel in the transmitted image, which defines whether it will be grayscale or black and white.

8D   8 bits per pixel, grayscale image *(default)*

1D   1 bit per pixel, black and white image

F – File Format

This option indicates the type of file format in which to save the image.

OF   KIM format

1F   TIFF binary

2F   TIFF binary group 4, compressed

3F   TIFF grayscale

4F   Uncompressed Binary

5F   Uncompressed grayscale

6F   JPEG image *(default)*

7F   Outlined image

8F   BMP format

H – Height of Signature Capture Area

The height of the signature capture area must be measured in inches divided by
.01. In the example, the height of the area to be captured is 3/8 inch, resulting in a
value of H = .375/0.01 = 37.5.

*Example: **IMGBOX245w37h55y.***

K - Gamma Correction

Gamma measures the brightness of midtone values produced by the image. You can brighten or darken an image using gamma correction. A higher gamma correction yields an overall brighter image. The lower the setting, the darker the image. The optimal setting for text images is 50K.

OK   Gamma correction Off *(default)*

50K   Apply gamma correction for brightening typical document image

*n*K   Apply gamma correction factor *n* (*n* = 1-255)

**Example of Gamma
Correction set to 0K:**

**Example of Gamma Correction
set to 50K:**

**Example of Gamma Correction
set to 255K:**
R - Resolution of Signature Capture Area

The resolution is the number of pixels that the scanner outputs per each minimum bar width. The higher the value for R, the higher the quality of the image, but also the larger the file size. Values begin at 1000. The scanner automatically inserts a decimal point between the first and second digit. For example, use 2500 to specify a resolution of 2.5. Set to zero when using the A and B modifiers (see A – Output Image Width and B – Output Image Height on page 164).

Example of Resolution set to 0R:
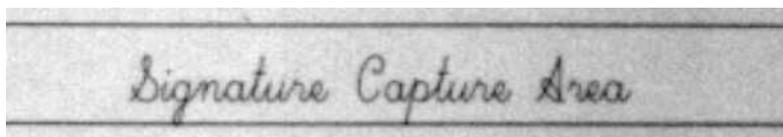

Example of Resolution set to 1000R:
Example of Resolution set to 2000R:
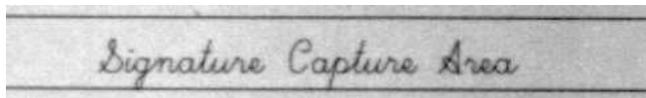

S - Barcode Aspect Ratio

All dimensions used in IMGBOX are measured as multiples of the minimum element size of the barcode. The barcode aspect ratio allows you to set the ratio of the barcode height to the narrow element width. In the example, the narrow element width is .010 inches and the barcode height is 0.400 inches, resulting in a value of S = 0.4/0.01 = 40.

W - Width of Signature Capture Area

The width of the signature capture area must be measured in inches divided by .01. In the example, the width of the area to be captured is 2.4 inches, resulting in a value of W = 2.4/0.01 = 240. (A value of 245 was used in the example to accommodate a slightly wider image area.)

Example: **IMGBOX245w37h55y.**

X - Horizontal Barcode Offset

The horizontal barcode offset allows you to offset the horizontal center of the signature capture area. Positive values move the horizontal center to the right and negative values to the left. Measurements are in multiples of the minimum bar width.

Example of Horizontal Offset set to 75X:

Example of Horizontal Offset set to –75X:
Y - Vertical Barcode Offset

The vertical barcode offset allows you to offset the vertical center of the signature capture area. Negative numbers indicate that the signature capture is above the barcode, and positive numbers indicate that the area is below the barcode. Measurements are in multiples of the minimum bar width.

Example of Vertical Offset set to –7Y:

Example of Vertical Offset set to 65Y:

UTILITIES
To Add a Test Code I.D. Prefix to All Symbologies

This selection allows you to turn On transmission of a Code I.D. before the decoded symbology. See the Symbology Charts, beginning on page 211) for the single character code that identifies each symbology. This action first clears all current prefixes, then programs a Code I.D. prefix for all symbologies. This is a temporary setting that will be removed when the unit is power cycled.

PRECA2,BK2995C80!
**Add Code I.D. Prefix to
All Symbologies (Temporary)**

Show Decoder Revision

Scan the barcode below to output the decoder revision.

Note: *This command is not supported with the Gen 7 software revision. For infomation about software revisions, see About Software Revisions on page 6.*

REV_DR.
Show Decoder Revision

Show Scan Driver Revision

Scan the barcode below to output the scan driver revision. The scan driver controls image capture.

Note: *This command is not supported with the Gen 7 software revision. For infomation about software revisions, see* About Software Revisions *on page 6.*

REV_SD.

Show Scan Driver Revision

Show Software Revision

Scan the barcode below to output the current software revision, unit serial number, and other product information for the scanner.

REVINF.

Show Revision

Show Data Format

Scan the barcode below to show current data format settings.

Data Format Settings

Test Menu

When you scan the Test Menu On code, then scan a programming code in this manual, the scanner displays the content of a programming code. The programming function will still occur, but in addition, the content of that programming code is output to the terminal.

Note: *This feature should not be used during normal scanner operation.*

TSTMNU1.

On

TotalFreedom

TotalFreedom is an open system architecture that makes it possible for you create applications that reside on your scanner. Decoding apps and Data Formatting apps can be created using TotalFreedom. For further information about TotalFreedom, go to our website at sps.honeywell.com.

Application Plug-Ins (Apps)

Any apps that you are using can be turned Off or On by scanning the following barcodes. Apps are stored in groups: Decoding, and Formatting. You can enable and disable these groups of apps by scanning that group's On or Off barcode below. You can also scan the List Apps barcode to output a list of all your apps.

PLGDCE1.

Note: *You must reset your device in order for the apps setting to take effect.*

EZConfig for Scanning Introduction

EZConfig for Scanning provides a wide range of PC-based programming functions that can be performed on the scanner connected to your PC. EZConfig for Scanning allows you to download upgrades to the scanner's firmware, change programmed parameters, and create and print programming barcodes. Using EZConfig for Scanning, you can even save/open the programming parameters. This saved file can be e-mailed or, if required, you can create a single barcode that contains all the customized programming parameters and mail or fax that barcode to any location. Users in other locations can scan the barcode to load in the customized programming.

Configure with EZConfig for Scanning

Use the EZConfig for Scanning tool to configure your scanner online:

1. Access the Honeywell Technical Support Downloads Portal at honeywell.com/PSSsoftware-downloads.

2. Go to **Software** > **Barcode Scanners** > **Software** > **Tools and Utilities** > **EZConfig for Scanning** > **Current**.
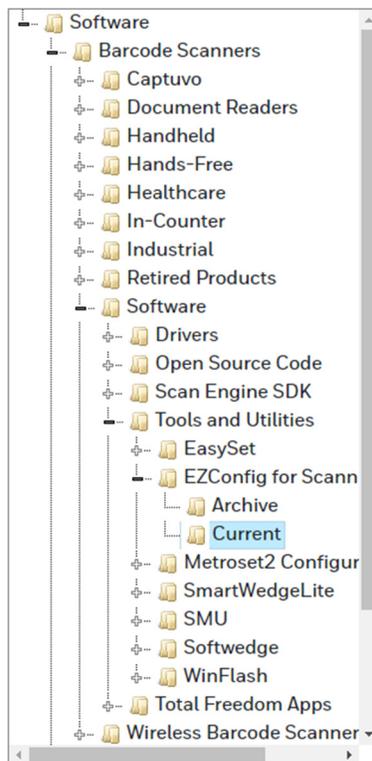

3. Download the **Setup** version of EZConfig for Scanning.

4. Open EZConfig to configure your scanner.

Resetting the Factory Defaults

⚠️ **Caution:** *This selection erases all your settings and resets the scanner to the original factory defaults. It also disables all plugins.*

If you aren't sure what programming options are in your scanner, or you've changed some options and want to restore the scanner to factory default settings, first scan the Remove Custom Defaults barcode, then scan Activate Defaults. This resets the scanner to the factory default settings.

DEFOVR.
Remove Custom Defaults

DEFALT.
Activate Defaults

The Menu Commands, beginning on page 180, list the factory default settings for each of the commands (indicated by an asterisk (*) on the programming pages).

10 SERIAL PROGRAMMING COMMANDS

The serial programming commands can be used in place of the programming barcodes. Both the serial commands and the programming barcodes will program the scanner. For complete descriptions and examples of each serial programming command, refer to the corresponding programming barcode in this manual.

The device must be set to an RS232 interface (see page 8). The following commands can be sent via a PC COM port using terminal emulation software.

Conventions

The following conventions are used for menu and query command descriptions:

parameter   A label representing the actual value you should send as part of a command.

[*option*]   An optional part of a command.

{Data}   Alternatives in a command.

bold   Names of menus, menu commands, buttons, dialog boxes, and win-dows that appear on the screen.

Menu Command Syntax

Menu commands have the following syntax (spaces have been used for clarity only):

Prefix [:Name:] Tag SubTag {Data} [, SubTag {Data}] [; Tag SubTag {Data}] [...] Storage

Prefix   Three ASCII characters: SYN M CR (ASCII 22,77,13).

:Name: This command is only used with cordless devices. It is used to specify whether you're communicating with the base or the scanner. To send information to the scanner (with the base connected to host), use :Xenon: The default factory setting for a Xenon scanner is Xenon

scanner. This setting is changed by using the BT_NAM command, which accepts alphanumeric values. If the name is not known, a wild-card (*) can be used :*

Note: *Since the base stores all work group settings and transfers to them to scanner once they are linked, changes are typically done to the base and not to the scanner.*

Tag   A 3 character case-insensitive field that identifies the desired menu command group. For example, all RS232 configuration settings are identified with a Tag of **232**.

SubTag   A 3 character case-insensitive field that identifies the desired menu command within the tag group. For example, the SubTag for the RS232 baud rate is **BAD**.

Data   The new value for a menu setting, identified by the Tag and SubTag.

Storage   A single character that specifies the storage table to which the com-mand is applied. An exclamation point (!) performs the command's operation on the device's volatile menu configuration table. A period (.) performs the command's operation on the device's non-volatile menu configuration table. Use the non-volatile table only for semi-permanent changes you want saved through a power cycle.

Query Commands

Several special characters can be used to query the device about its settings.

^   What is the default value for the setting(s).

?   What is the device's current value for the setting(s).

*   What is the range of possible values for the setting(s). (The device's response uses a dash (–) to indicate a continuous range of values. A pipe (|) separates items in a list of non-continuous values.)

:Name: Field Usage (Optional)

This command returns the query information from the scanner.

Tag Field Usage

When a query is used in place of a Tag field, the query applies to the *entire* set of commands available for the particular storage table indicated by the Storage field of the command. In this case, the SubTag and Data fields should not be used because they are ignored by the device.

SubTag Field Usage

When a query is used in place of a SubTag field, the query applies only to the subset of commands available that match the Tag field. In this case, the Data field should not be used because it is ignored by the device.

Data Field Usage

When a query is used in place of the Data field, the query applies only to the specific command identified by the Tag and SubTag fields.

Concatenation of Multiple Commands

Multiple commands can be issued within one Prefix/Storage sequence. Only the Tag, SubTag, and Data fields must be repeated for each command in the sequence. If additional commands are to be applied to the same Tag, then the new command sequence is separated with a comma (,) and only the SubTag and Data fields of the additional command are issued. If the additional command requires a different Tag field, the command is separated from previous commands by a semicolon (;).

Responses

The device responds to serial commands with one of three responses:

ACK   Indicates a good command which has been processed.

ENQ   Indicates an invalid Tag or SubTag command.

NAK   Indicates the command was good, but the Data field entry was out of the allowable range for this Tag and SubTag combination, e.g., an entry for a minimum message length of 100 when the field will only accept 2 characters.

When responding, the device echoes back the command sequence with the status character inserted directly before each of the punctuation marks (the period, exclamation point, comma, or semicolon) in the command.

Examples of Query Commands

In the following examples, a bracketed notation [ ] depicts a non-displayable response.

Example: What is the range of possible values for Codabar Coding Enable?

Enter: **cbrena*.**

Response: **CBRENA0-1[ACK]**

This response indicates that Codabar Coding Enable (CBRENA) has a range of values from 0 to 1 (Off and On).

Example: What is the default value for Codabar Coding Enable?

       Enter: **cbrena^.**

       Response: **CBRENA1[ACK]**

       This response indicates that the default setting for Codabar Coding Enable (CBRENA) is 1, or On.

Example: What is the device's current setting for Codabar Coding Enable?

       Enter: **cbrena?.**

       Response: **CBRENA1[ACK]**

       This response indicates that the device's Codabar Coding Enable (CBRENA) is set to 1, or On.

Example: What are the device's settings for all Codabar selections?

       Enter: **cbr?.**

       Response: **CBRENA1[ACK],**
                       SSX0[ACK],
                       CK20[ACK],
                       CCT1[ACK],
                       MIN2[ACK],
                       MAX60[ACK],
                       DFT[ACK].

       This response indicates that the device's Codabar Coding Enable (CBRENA) is set to 1, or On;
the Start/Stop Character (SSX) is set to 0, or Don't Transmit;
the Check Character (CK2) is set to 0, or Not Required;
concatenation (CCT) is set to 1, or Enabled;
the Minimum Message Length (MIN) is set to 2 characters;
the Maximum Message Length (MAX) is set to 60 characters;
and the Default setting (DFT) has no value.

Trigger Commands

You can activate and deactivate the scanner with serial trigger commands. First, the scanner must be put in Manual Trigger Mode by scanning a Manual Trigger Mode barcode (see Manual Trigger Modes on page 37), or by sending a serial menu command for triggering (see Serial Trigger Mode on page 185). Once the scanner is in serial trigger mode, the trigger is activated and deactivated by sending the following commands:

Activate: **SYN T CR**

Deactivate: **SYN U CR**

The scanner scans until a barcode has been read, until the deactivate command is sent, or until the serial time-out has been reached (see Read Time-Out on page 40 for a description, and the serial command on page 185).

Resetting the Custom Defaults

If you want the custom default settings restored to your scanner, scan the **Activate Custom Defaults** barcode below. This resets the scanner to the custom default settings. If there are no custom defaults, it will reset the scanner to the factory default settings. Any settings that have not been specified through the custom defaults will be defaulted to the factory default settings.

DEFALT.

Activate Custom Defaults

The charts on the following pages list the factory default settings for each of the commands (indicated by an asterisk (*) on the programming pages).

11 PRODUCT SPECIFICATIONS

3320 Scanner Product Specifications

Parameter	Specification
Dimensions (Typical):	
Height	1.0 inches (26mm)
Length	2.9 inches (73mm)
Width	2.0 inches (51mm)
Weight	2.7 ounces (77g)
Wavelength:	
Illumination LED	633nm
Aimer LED	528nm
Image Size	844 x 640 pixels
Skew Angle	±65°
Pitch Angle	±45°
Motion Tolerance: Enhanced Streaming Presentation Trigger	SR, HD version: up to 200 inches per second for 13 mil UPC ER version: up to 106 inches per second for 13 mil UPC
Symbol Contrast	Grade 1.0 (20% or greater)
Voltage Requirements	4 - 5.5 VDC at input connector
Current Draw @5VDC	Scanning Standby 450mA, 2.3W90mA, 0.45W
Power Supply Noise Rejection	Maximum 100mV peak to peak, 10 to 100 kHz
Temperature Ranges:	
Operating	-4°F to +122°F (-20°C to 50°C)
Storage	-4°F to +158°F (-20°C to 70°C)
Humidity	5 to 95% non-condensing

Mechanical Drop	Operational after 30 drops from 4.9 feet (1.5m) to concrete at 23°C
Vibration	Withstands 5G peak from 22 to 300 Hz
ESD Tolerance	Up to 15kV direct air Up to 8 kV indirect coupling plane
Solids and Water Protection	IP53

Depth of Field

Typical Performance

	mm	47	377	23	201	102	406

Note: *Performance may be impacted by barcode quality and environmental conditions.*

Mounting Specifications

The 3320 has three M3 x 0.5mm threaded inserts (5.0mm maximum depth) on the bottom of the scanner for mounting with screws. Do not exceed 3cm-kg torque.
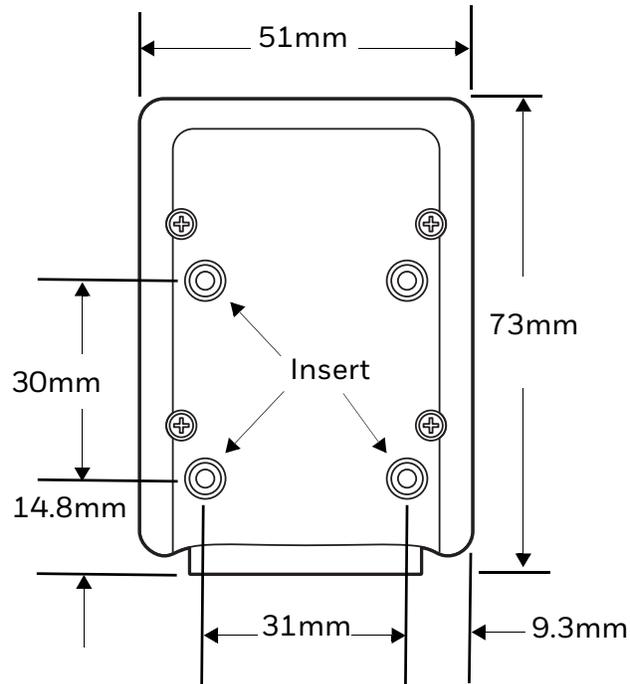

Mounting General Guidelines

- Avoid specular reflections, caused by ambient and internal light sources.
- The barcode should be slightly off perpendicular to the axis of the scanner.
- To reduce specular reflections, the skew angle can vary significantly depending on the application such as: ambient illumination sources, code size, and code type.
- Excessive angles should be avoided.
- Other factors, such as surface qualities, mounting distances, secondary windows, and external illumination can easily impact these recommendations.
- If a secondary window is used, the window should be mounted as close to the front of scanner as possible at a 90° angle to the optical axis to avoid specular reflections.
- For secondary windows, Honeywell recommends the following:
- Optical quality glass
- >95% transmission in the nominal 650nm wavelength
- Anti-reflective coating on both sides

- Avoid window thickness above 2mm
- A skew angle of 15º to 20º between the normal of the barcode's surface and the optical axis of the imager is sufficient to avoid specular reflections.
- Avoid pitch angles above 20º to prevent code compression.

MAINTENANCE AND TROUBLESHOOTING

Repairs

Repairs and/or upgrades are not to be performed on this product. These services are to be performed only by an authorized service center (see Customer Support on page xiii).

Maintenance

Your device provides reliable and efficient operation with a minimum of care. Although specific maintenance is not required, the following periodic checks ensure dependable operation:

Cleaning the Scanner

The scanner's housing may be cleaned with a soft cloth or tissue dampened with water (or a mild detergent-water solution.) If a detergent solution is used, rinse with a clean tissue dampened with water only.

⚠ **Caution: Do not submerge the scanner in water. The scanner's housing is not watertight. Do not use abrasive wipes or tissues on the scanner's window. Abrasive wipes may scratch the window. Never use solvents (e.g., acetone) on the housing or window. Solvents may damage the finish or the window.**

Cleaning the Window

Reading performance may degrade if the scanner's window is not clean. If the window is visibly dirty, or if the scanner isn't operating well, clean the window with one of the cleaning solutions listed below.

- Sani-Cloth® HB wipes

- Sani-Cloth® Plus wipes

- Super Sani-Cloth® wipes

- Isopropyl Alcohol wipes (70%)

- CaviWipes™

- Virex® 256

- 409® Glass and Surface Cleaner

- Windex® Blue

- Clorox® Bleach – 10%

- Gentle dish soap and water

Inspecting Cords and Connectors

Inspect the interface cable and connector for wear or other signs of damage. A badly worn cable or damaged connector may interfere with scanner operation. Contact your distributor for information about cable replacement. Cable replacement instructions are on .

Replacing Cables

The standard interface cable is attached to the scanner with an 15-pin modular connector. The interface cable is designed to be field replaceable.

- Order replacement cables from Honeywell or from an authorized distributor.

- When ordering a replacement cable, specify the cable part number of the original interface cable.

Replacing an Interface Cable

1. Turn the power to the host system OFF.

2. Disconnect the scanner's cable from the terminal or computer.

3. Rotate the two screws counter clockwise to loosen the screws.

4. Gently pull the connector.

5. Replace with the new cable.
   Insert the connector into the socket on the 3320.
   Rotate the two screws clockwise to tighten.
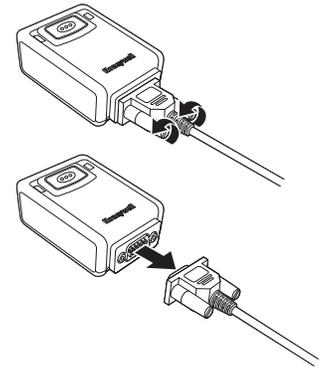

Troubleshooting a Corded Scanner

The scanner automatically performs self-tests whenever you turn it On. If your scanner is not functioning properly, review the following Troubleshooting Guide to try to isolate the problem.

Is the power On? Is the aimer On?

If the aimer isn't illuminated, check that:

- The cable is connected properly.

- The host system power is On (if external power isn't used).

- The button works.

Is the scanner having trouble reading your symbols?

If the scanner isn't reading symbols well, check that the symbols:

- Aren't smeared, rough, scratched, or exhibiting voids.

- Aren't coated with frost or water droplets on the surface.

- Are enabled in the scanner or in the decoder to which the scanner connects.

Is the barcode displayed but not entered?

The barcode is displayed on the host device correctly, but you still have to press a key to enter it (the Enter/Return key or the Tab key, for example).

- You need to program a suffix. Programming a suffix enables the scanner to output the barcode data plus the key you need (such as "CR") to enter the data into your application. Refer to Prefix/Suffix Overview on page 61 for further information.

The scanner won't read your barcode at all.

1. Scan the sample barcodes in the Programming Chart, beginning on page 222. If the scanner reads the sample barcodes, check that your barcode is readable. Verify that your barcode symbology is enabled (see Chapter 7).

2. If the scanner still can't read the sample barcodes, scan All Symbologies On on page 94.

If you aren't sure what programming options have been set in the scanner, or if you want the factory default settings restored, refer to Activate Custom Defaults on page 6.

A REFERENCE CHARTS

Symbology Charts

Note: *"m" represents the AIM modifier character. Refer to International Technical Specification, Symbology Identifiers, for AIM modifier character details.*

Prefix/Suffix entries for specific symbologies override the universal (All Symbologies, 99) entry.

Refer to Data Editing on page 61 and Data Formatting on page 67 for information about using Code ID and AIM ID.

ISO 2022/ISO 646 Character Replacements

Code pages define the mapping of character codes to characters. If the data received does not display with the proper characters, it may be because the barcode being scanned was created using a code page that is different from the one the host program is expecting. If this is the case, select the code page with which the barcodes were created. The data characters should then appear properly.

Code Page Selection Method/ Country	Standard	Keyboard Country	Honeywell Code Page Option
United States (standard ASCII)	ISO/IEC 646-IRV	n/a	1
Automatic National Character Replacement	ISO/IEC 2022	n/a	2 (default)
Binary Code page	n/a	n/a	3
Default "Automatic National Character replacement" will select the below Honeywell Code Page options for Code128, Code 39 and Code 93.			
United States	ISO/IEC 646-06	0	1
Canada	ISO /IEC 646-121	54	95
Canada	ISO /IEC 646-122	18	96
Japan	ISO/IEC 646-14	28	98
China	ISO/IEC 646-57	92	99
Great Britain (UK)	ISO /IEC 646-04	7	87
France	ISO /IEC 646-69	3	83
Germany	ISO/IEC646-21	4	84
Switzerland	ISO /IEC 646-CH	6	86
Sweden / Finland (extended Annex C)	ISO/IEC 646-11	2	82
Ireland	ISO /IEC 646-207	73	97
